

Report on 7th EUROCONTROL Innovative Research Workshop

Dr. Colin Meckiff
EUROCONTROL Experimental Centre, Brétigny sur Orge, France

Presented at
ENRI International Workshop on ATM/CNS
March 2009, Tokyo, Japan

European Organisation for the Safety of Air Navigation

Brief history of the workshop

- Held each year in December at EUROCONTROL Experimental Centre, France
- Now on 7th in the series
- Started as a forum for PhD students with around 40 participants
- 2008 saw:
 - 230 participants
 - >40 papers
 - a dozen exhibits

Highlighted papers

- This presentation introduces a handful of papers that (arguably) represent the state of the art in their subjects¹:
 - Man-machine interaction, collaboration and automation
 - ASAS
 - Economics
 - + environment and future communications
- There are some recurrent themes

¹to be discussed ... over a cocktail!

References

- All full papers and presentations available on the website:
inoworkshop.eurocontrol.fr
- Also a couple of videos
- All slides in this presentation used with agreement

Man-machine interaction, collaboration and automation

Highlighted paper: *Concept, Content, Containers and Controls for 3D in 2D Planar Displays for ATC* (Wong et al, Interaction Design Centre, Middlesex University)

- New display and interaction techniques
 - Used readily available devices used to explore new possibilities
- Rather than using 3D for a spatial-perspective view, support perception of important invariant functional relationships or key dimensions of cognitive work
 - Example: energy management

D3.1 Review: Alternate Display Technologies

- ❖ **To consider how alternative and advance display technologies could influence how the ATC task is performed under SESAR**
- ❖ **Any future display should assist controllers, pilots ...**
 - ❖ Recognise deceptive situations and compensate for human limitations in perception, attention and memory
 - ❖ Discover conflicts and better SA
- ❖ **Goggles - projected, shutters**
- ❖ **Glasses - blue/red anaglyph**
- ❖ **Lenticular, autostereoscopic displays**
- ❖ **Gaze-Contingent Displays**
- ❖ **Multi-touch interaction, iPhone - Mitsubishi MERL**
- ❖ **Gestural interaction**
- ❖ **'Imagineer' future interface => Un-tethered, and un-encumbered spatial and proprioceptive displays, interaction with chorded gestures**
 - ❖ At the moment, this may still be too far ahead.

3D-in-2D Display Project History: ARToolkit Prototypes

Reach-in-and-grab

Operational Concepts 1: Exploit 3D as Multi-dimensional Info rather than Spatial-Perspective Views

- ❖ **Often 3D used in aviation domain refers to spatial perspective views (e.g. the use of VR)**
 - ❖ This is a limiting concept as we try to mimic the real world airspace and its limitations, rather than creating powerful new affordances
- ❖ **Instead, displays should support perception of important invariant functional relationships or key dimensions of cognitive work**
 - ❖ Off-load intensive mental computations onto the visual representations that a pilot or controller can use to plan, execute and adapt
 - ❖ E.g. Energy profiles rather than a flight path

Pinch-and-Pull supported by Malleable 3D Tubes, Rings for 4DET, and the Energy Profile display

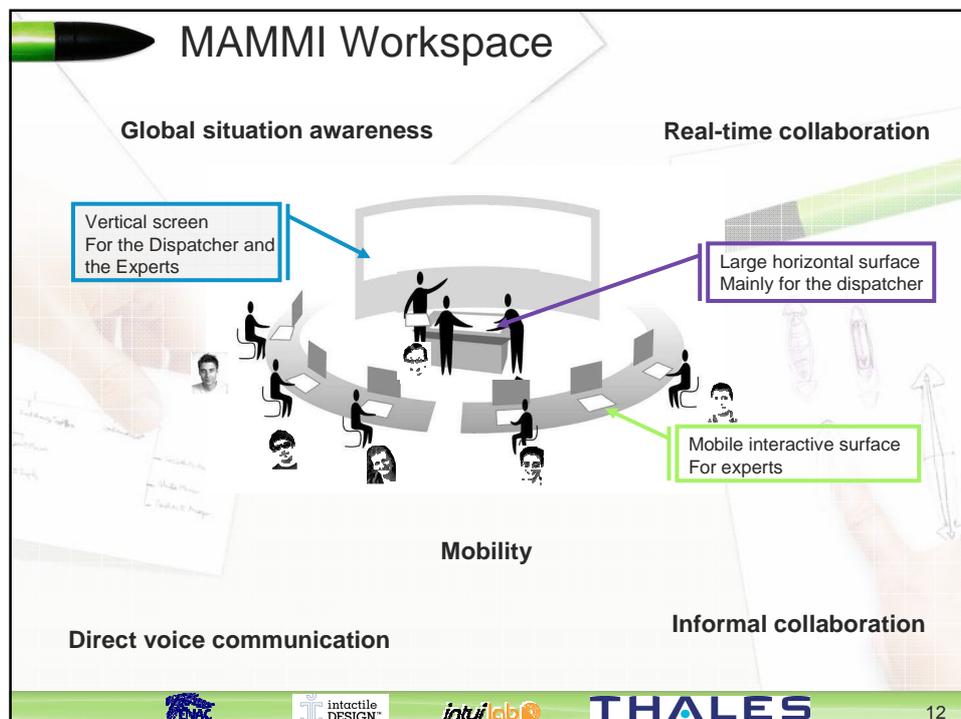

4DT => 4DET 4D-Energy Trajectory (4DET) Re-planning: An Example of how Controller-Pilot coordination might occur

Man-machine interaction, collaboration and automation

Highlighted paper: *MAMMI: Exploring Collaborative Workspaces for Air Traffic Controllers in the Scope of SESAR* (Vales et al, Intuilab, Thales, Intactile, ENAC)

- Collaboration is a word that tends to be over-used
- MAMMI looked at both workflow and physical interaction
 - Focussed on roles of multi/meta sector planner and tactical controller
 - Object of the collaboration is Reference Business Trajectory
 - Key enabler is SWIM

HMI solution overview for the dispatcher

MAMMI: a study in collaboration

- Collaborative workflow and interfaces need to be designed hand-in-hand
- Scenarios have been developed for cabin emergencies, weather, deviations, conflicts
- Linked into SESAR operational concepts

Autonomous Separation Assistance Systems (ASAS)

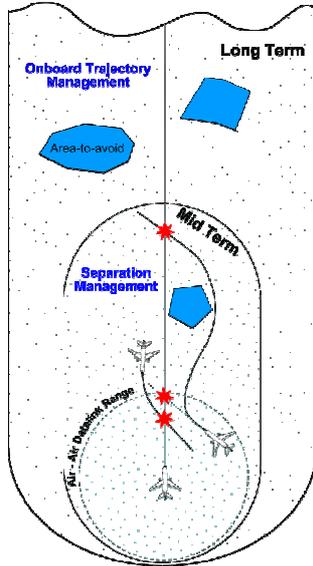

Highlighted paper: *Airborne System for Self-Separation in a Trajectory-Based Airspace* (Casek et al, iFly/Honeywell)

- Important since it engages a major avionics manufacturer
- iFly avionics architecture integrates:
 - SWIM
 - mid-term conflict detection
 - long-term zone avoidance

Situation Awareness

Honeywell

Areas of interest:

- Long Term Awareness Zone(LTAZ) – relevant for Trajectory Management (optimization)
- Mid Term Awareness Zone(MTAZ) – used for Separation Management
- Air-Air Data link Range – additional state-based Conflict Detection

A3 Airborne System Architecture Overview

Honeywell

Information Management

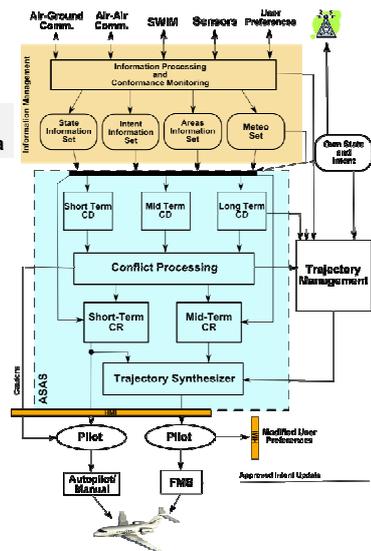

- Shields communications details
- Collect and process required data

Separation & Trajectory Management

- Situation Assessment
- Resolution Advisories

Human Machine Interface

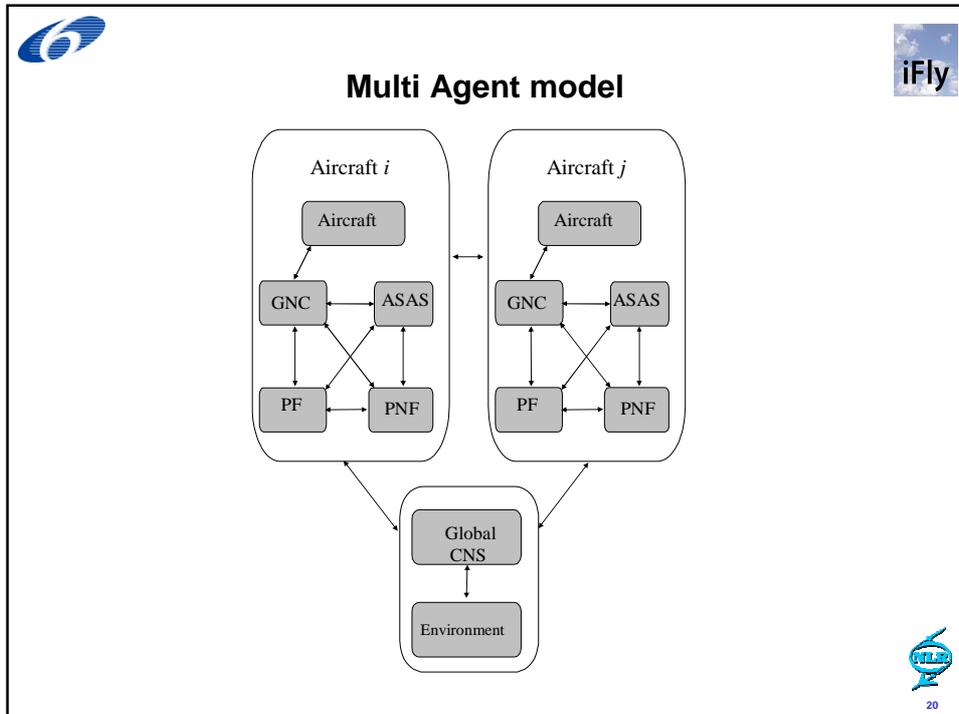

- Situation Awareness
- Flight changes advisories

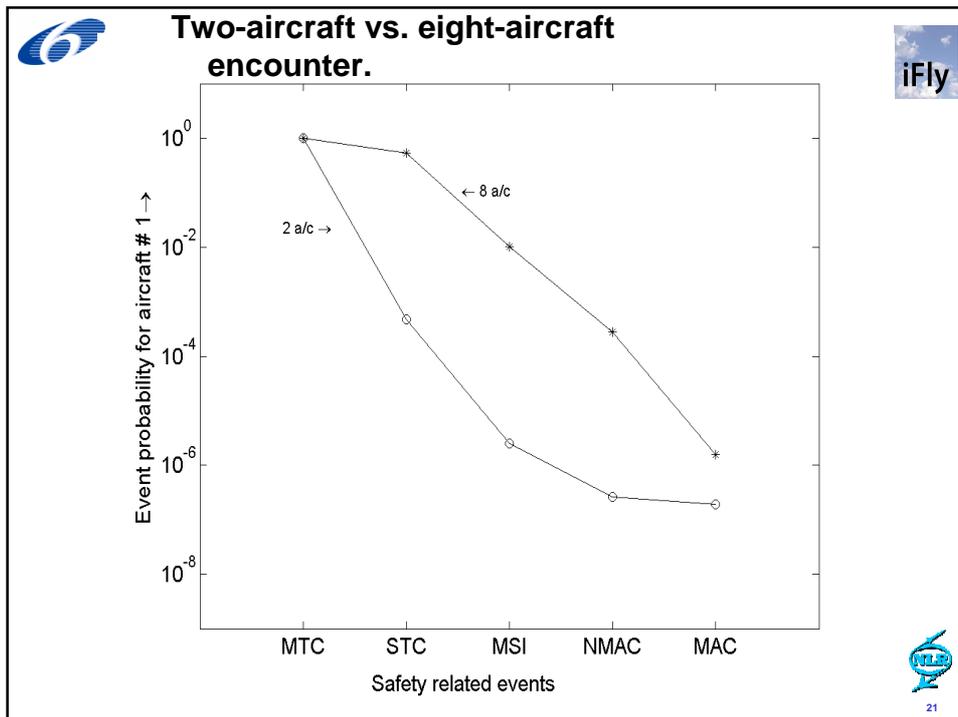

Autonomous Separation Assistance Systems (ASAS)

Highlighted paper: *Simulated Collision Risk of an Uncoordinated Airborne Self-Separation Concept of Operation* (Blom et al, iFly/NLR)

- Safety is a prime concern, particularly if there is no coordination e.g. exchange of intent data.
 - Priority rules do apply
- Collision risk modelled using TOPAZ methodology

- ## Conclusions
- **We identified novel behaviour, which emerges from the combined dynamical interactions of Joint Cognitive Systems (or Multi Agent System), and which has not shown before for AMFF**
 - **Solving conflicts one by one in free flight, falls short in safely accommodating high en route traffic demand.**
 - **Follow-up work on risk assessment:**
 - Include ACAS, etc. in simulation model
 - Consider other free flight/ASAS based operations
 - Improve modeling and novel simulation speed-up
 - Validation of assessed risk level

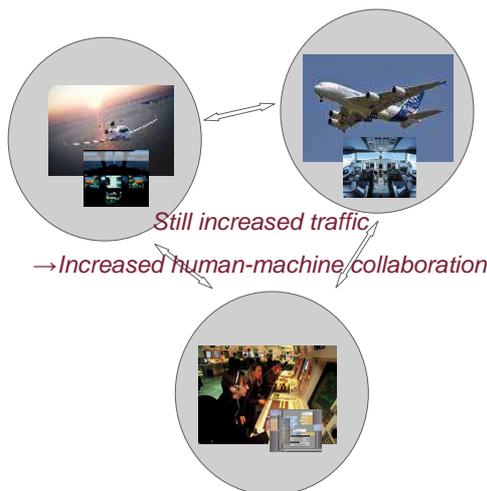

Autonomous Separation Assistance Systems (ASAS)

Highlighted paper: *A Socio-Cognitive Descriptive Modelling Approach to Represent Authority Distribution*
(Straussberger et al, Eurisco, LORIA, Dassault)

- Who is responsible between ground and air has long been an issue for ASAS
- The PAUSA project developed a model specifically to look at authority sharing in ATM including human and machine actors

Changing authority concepts

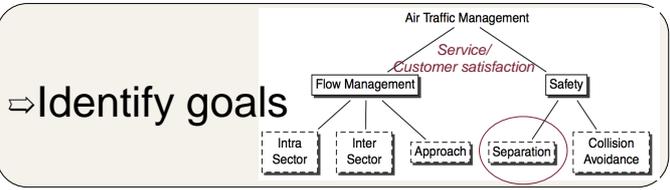

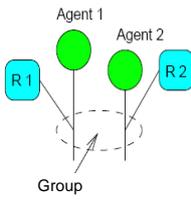

TOMORROW

- Human remains in the loop, but future operational concepts contain a new dimension of « Who does what and when »
- ATCO is no longer single point of cognition to ensure stability, flexibility, and consistency
- Dynamic variations of distributions and structures of a given authority

The organizational modeling

⇒ Identify agents

Airside Agents (A380, A321, Falcon9000)		Groundside Agents	
Human	Machine	Human	Machine

An ASAS Example

Separation today

S&M Target selection

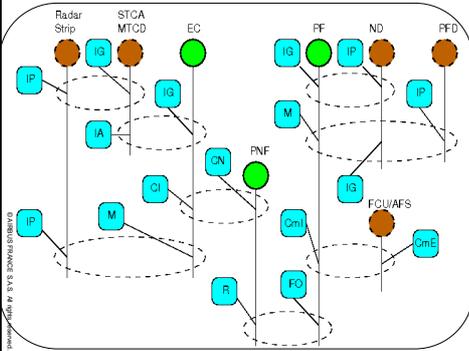

- 1 EC(IG) uses information provided by RADAR and by conflicts detected by MTCD or STCA. To solve conflicts, EC issues clearances to aircraft, aircraft executes clearances.
- 2 PNF(CN) communicates with ground and relays to PF(CmI) who transforms clearance in command by FCU(CmE).
- 3 PF monitors through ND(IP) and PFD(IP).

An ASAS Example

Separation today

S&M Target selection

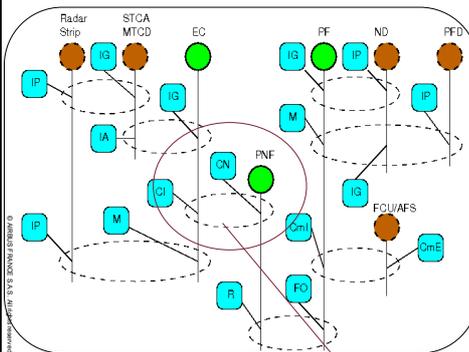

- 1 EC(IG) issues clearance to PNF(CN) that indicates target aircraft and confirms action on Specific HMI(IG)
- 2 PF (CN) operates autopilot to follow target and sends command to FMGS.
- 3 FMGS manages separation with other aircraft using the information on target's transponder, PNF monitors execution of maneuver.

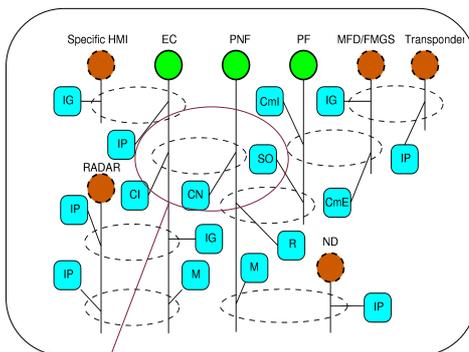

An ASAS Example

Separation today

S&M Target selection

authority delegation function

Crew – marginal delay costs

- Considered cross-section of AO payment schemes, pilot & cabin crew salaries (2008)
- Pilots' salaries increase by size of aircraft
- Cabin crew salaries vary less
 - numbers driven by maximum number of seats available
 - used ICAO 2006 fleet data, over 4000 aircraft, unusual configurations excluded
- Annual block/flight duty hours, sectors flown and overnight stopovers used to derive time-based rates
- On-costs (e.g. pension contributions) included
 - since calculating cost to airline; these averaged 20-40%

Crew – marginal delay costs

- Low cost scenario
 - for certain delays, e.g. under 'flying/block pay' or 'sector pay' mechanisms, it is possible that no extra payment will be made as a result of a delay (value thus set at zero)
- Base cost scenario
 - 'proxy' payment rates calculated, taking into account typical working hours, plus constraints of 28-day and annual flight & duty hours limited by Regulation (EC) 1899
- High cost scenario
 - overtime rates & a/c configuration for full-service carrier
- In the prototype tool (TDD 8.0)
 - user can mix and match, e.g. allocate low cost scenario for at-gate phase, and base cost scenario for airborne phase

Total, marginal crew costs by scenario

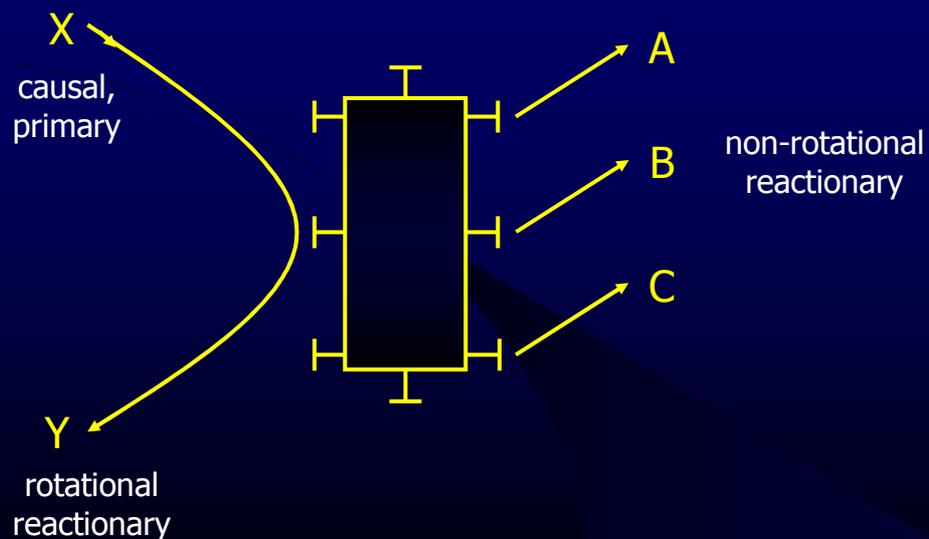

Aircraft	Low	Base	High
B737-300	0	8.1	16.9
B737-400	0	7.8	17.0
B737-500	0	7.6	16.5
B737-800	0	8.6	18.6
B757-200	0	8.6	17.2
B767-300ER	0	12.2	33.0
B747-400	0	15.9	43.0
A319	0	7.0	14.5
A320	0	7.4	15.4
A321	0	7.4	15.4
ATR42-300	0	5.4	11.0
ATR72-200	0	5.8	12.4

(Per-aircraft, per-minute costs in Euros. On-costs included. At-gate/airborne.)

UNIVERSITY OF WESTMINSTER

Emissions – charging and impacts

CO₂ (please see dedicated report)

- warming effect; proportional to fuel burn; altitude-independent
- Kyoto Protocol (domestic aviation in national emission targets)
- EU ETS: extending to aviation 2012; gate-to-gate fuel burn
- legislation currently: all AOs operating to/from EU surrender permits

NOX (NO & NO₂: please see dedicated report)

- warming effect (↑O₃); cooling effect (↓CH₄)
- current regulation: certif new aircraft engines; limits LTO emissions
- unregulated above 3000 ft; Commission developing policy by 2009
- probably to operate parallel to inclusion aviation CO₂ in EU ETS
- lower cruise can increase NOx but reduce climate impact ...

Economics

Highlighted paper: *A Market-Based Mechanism to Assign Priorities Amongst Flights* (Ranieri et al, University of Trieste)

- Where resources (airspace, airports) are capacity-constrained (planned demand > available capacity) delay is generally imposed without regard to the nature of different flights
- SESAR requires that airspace users will be fully involved in the process of demand and capacity balancing
 - UDPP, User-Driven Prioritisation Process, works at tactical level to manage unforeseen shortfalls

UDPP?

"I THINK YOU SHOULD BE MORE EXPLICIT HERE IN STEP TWO."

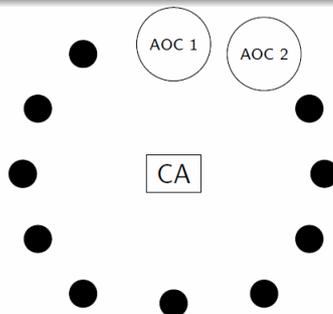

The Use of Combinatorial Auctions to Sequence Flights

Our proposal

A possible implementation of UDPP is based on an **iterative combinatorial auction** according to which:

- A Central Authority (CA) iteratively determines price of resources according to the current excess of demand;
- Airlines decide for each flight if it is preferable to acquire resources at the current market price or accept the delay;

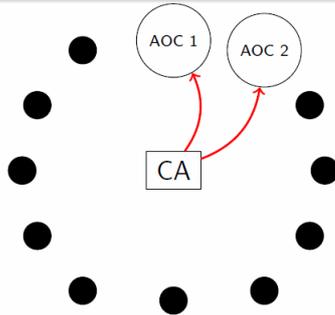

The Use of Combinatorial Auctions to Sequence Flights

Andrea Ranieri - araniei@units.it

Market Based Mechanism to Assign Priorities Among Flights

Market-based mechanisms

- This mechanism shows several positive features:
 - it is distributed
 - it starts from the well accepted FCFS solution
 - it looks for an improved solution to the FCFS allocation
 - everybody is better-off
 - it is incentive compatible
- ... At least it's a start!

A brief mention of environment

Mentioned in my overview:

- A couple of papers that describe storm tracking and forecasting techniques that appear especially interesting for application to 4D trajectory planning
- Atmospherics, including a paper on computation and effects of dust ingestion, potentially of increasing concern due to changing desert configurations

Future communications

- A breakout workshop was held to discuss future communication strategies and options
- Based on work done between Europe and the US
 - Good convergence in some areas (airport surface)
 - Work ongoing in other (continental datalink: L-Band non-interfering solution)
 - New work on design for next generation satellite systems to meet ATM requirements

Conclusion

- This has been a rapid and incomplete overview of the 7th INO Workshop held last December
- The workshop exposed many new ideas, often specifically targeted at new concepts such as SESAR
- Proceedings and presentations are available at *inoworkshop.eurocontrol.fr*
