

The 2nd ENRI International Workshop on ATM/CNS

Akihabara, Tokyo, Japan
10 November, 2010

Ministry of Land, Infrastructure, Transport and Tourism

Theme topic for EIWACS 2010
FORSEE: FOR (e) Safety, Efficiency and Environment

1. What's "CARATS" ?
2. Background
3. Trend & Characteristics of air traffic in/around Japan
4. Outline of "CARATS"
5. Goals of "CARATS"
6. Directions of ATM Renovations
7. Work plan for 2010
8. R&D aspect in CARATS

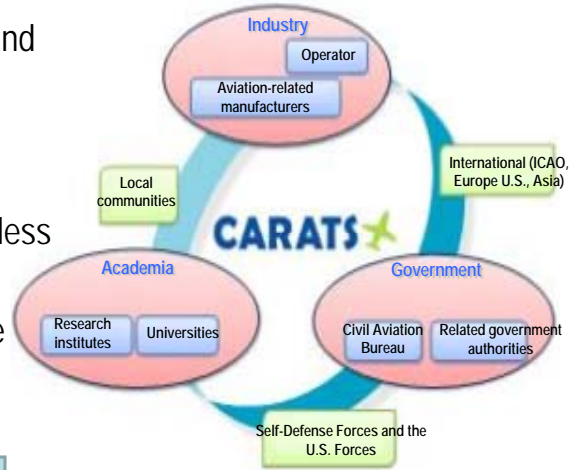

Civil Aviation Bureau Japan

1. What's "CARATS" ?

In order to effectively and efficiently work on future ATM systems, we need;

1. Collaboration among industry, academia and government;
2. Collaboration between operators and air navigation service providers;
3. International collaboration to realize seamless air traffic environment;
4. Collaboration among co-users of air space (civil, Self-Defense Force, US Force); and
5. Collaboration with local communities

CARATS :
Collaborative Actions for Renovation of Air Traffic Systems

2. Background (1)

Social and Economic Challenges in Japan

A "Growth Strategy" needed to sustain Japan's economy and enhance its international position

"Aviation" is one of essential foundations for social and economic development and upgrading of life standards

Improvement of aviation services level needed in both quality and quantity

For example, ATC capacity enlargement in congested air spaces and streamlining air traffic systems, while meeting users and social needs

Air Traffic Systems, through its renovation, will continue to be a cornerstone for future growth of Japan

2. Background (2)

Constraints in present ATM systems

- Shortage of ATC capacity unable to meet high demand of air traffic
- Chronic delay of traffic due to the ATC overload
- Inefficient operation due to inflexible use of airspaces and routes
- Accidents/incidents attributable to human errors and HMI under the current systems

Load factors of ATC sectors when traffic increases by 1.5 times

Civil airspaces surrounded by military training zones

“Dynamic” and “Strategic” renovation of Air Traffic Systems

Global Trend in “Global ATM Concept” Crystallization

- **ICAO**: Adopted “Global ATM Operational Concept(Doc.9854)” targeting at 2025, has been promoting the Concept with its stress on global harmonization.
- **US/EU**: Completed an ATM master plan and are now in development phase
- **Asia/Pacific**: Some States maybe are studying its own master plan or having one, but neither the regional nor sub-regional programme does exist.

Intra-regional and inter-regional cooperation for realizing “Global ATM”

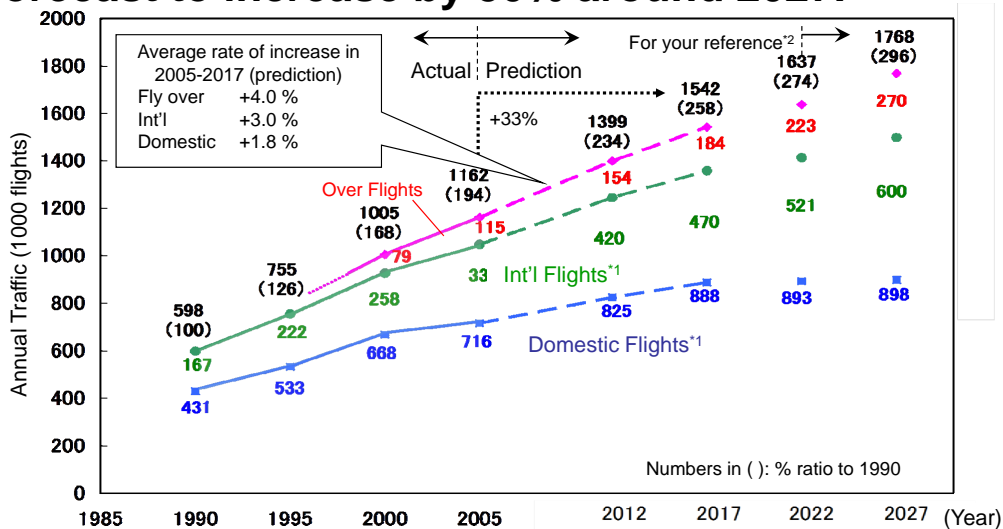

Civil Aviation Bureau Japan

3. Trend/Characteristics of air traffic (1)

Looking at domestic and int'l traffic to/from Japan, ...

✈️ The number of flight, including overflight, is forecast to increase by 50% around 2027.

*1: Prediction of demand is premised on the capacity limitation of metropolitan airports.

*2: The figures beyond 2022 is tentative prediction and will be re-forecast at the next reviewing process.

Civil Aviation Bureau Japan

3. Trend/Characteristics of air traffic (2)

Looking at intra/inter regional traffic of Asia, ...

✈️ A steady increase of air traffic in the Asia/Pacific region, along with its robust economy. Still, further growth is expected.

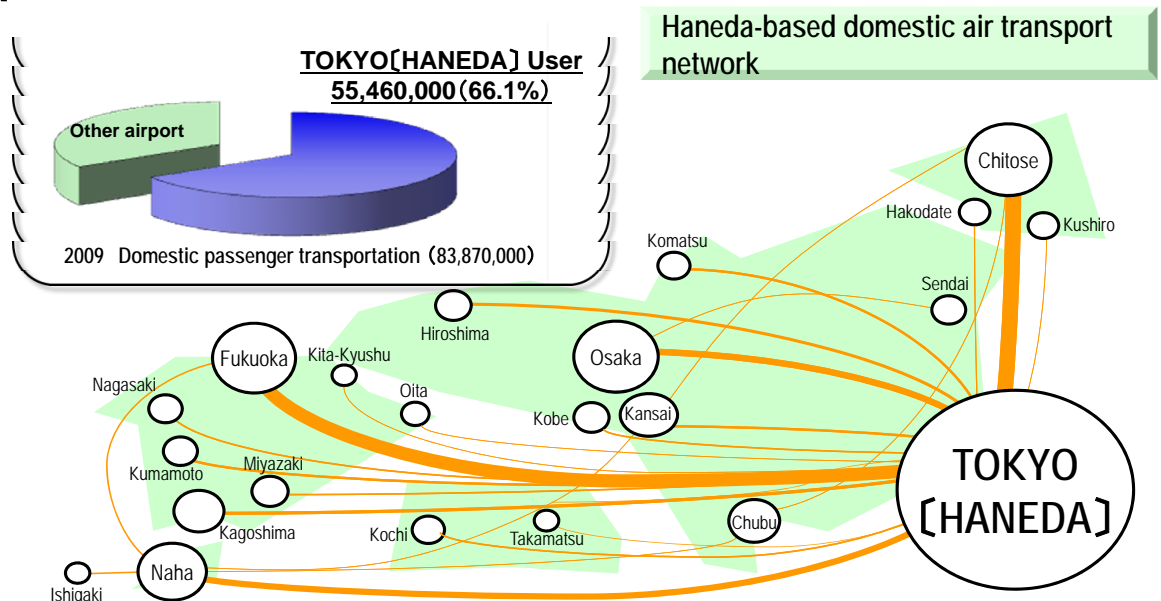

Civil Aviation Bureau Japan

3. Trend/Characteristics of air traffic (3)

Looking at a domestic air transport network, ...

✈️ Convergence of air traffic into the metropolitan area.

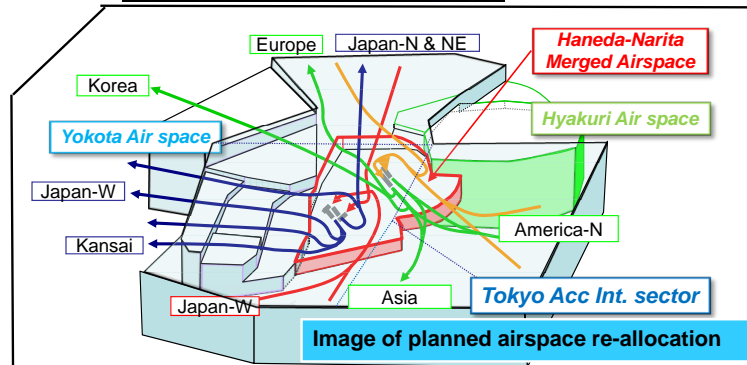

Civil Aviation Bureau Japan

3. Trend/Characteristics of air traffic (4)

Looking at a traffic flux over metroplex, ...

✈ Congested flows of air traffic, radar-vector'd through segmented and layered airspaces.

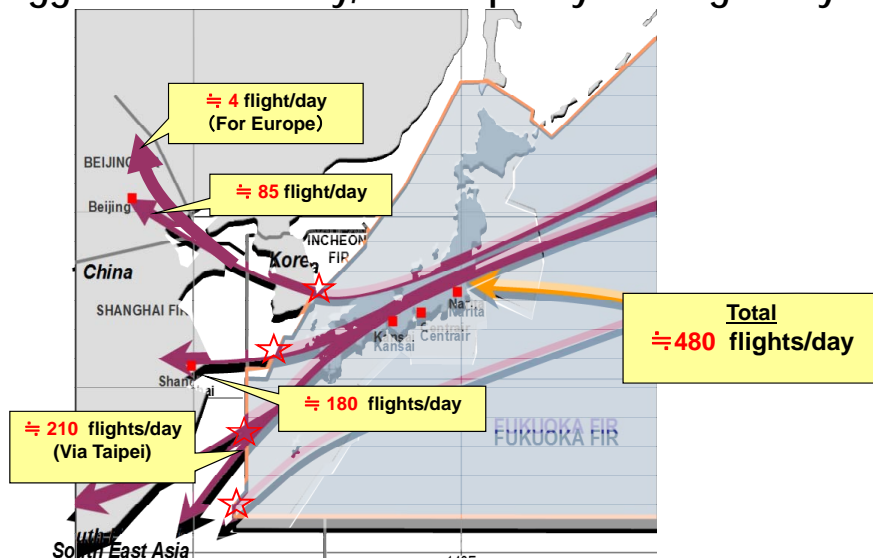

Civil Aviation Bureau Japan

3. Trend/Characteristics of air traffic (5)

Looking up at the air corridor above us, ...

✈ A hike of over flight and cross-boundary traffic in Fukuoka FIR can aggravate efficiency, ATC capacity and regularity.

Note: The figures are daily average number of aircraft controlled by Fukuoka ATM Center in 2007.

Civil Aviation Bureau Japan

3. Trend/Characteristics of air traffic (6)

Looking at air navigation service clients, ...

✈️ — High expectation of “rapidness” in transportation

✈️ — High expectation in “regularity” of transportation

On-Time Arrival Rate

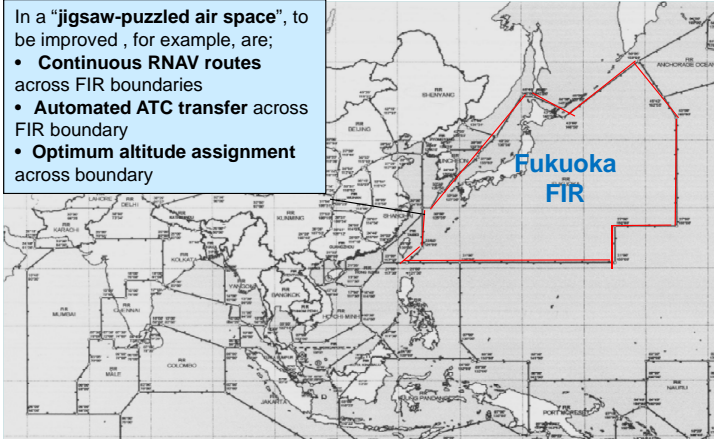

Serviceability of Flight

3. Trend/Characteristics of air traffic (7)

In a “jigsaw-puzzled air space”, to be improved, for example, are;

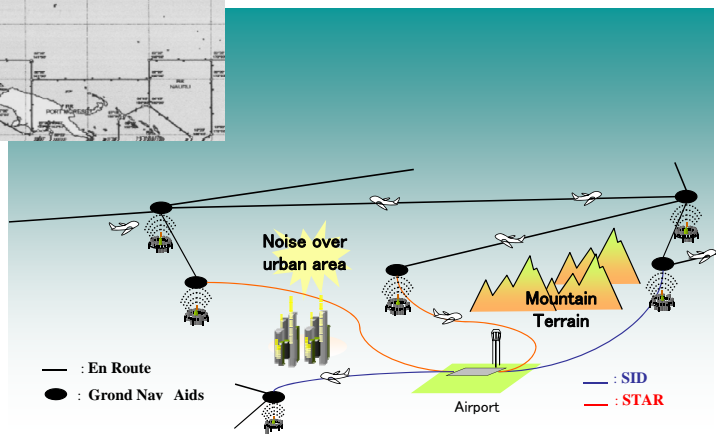

- Continuous RNAV routes across FIR boundaries
- Automated ATC transfer across FIR boundary
- Optimum altitude assignment across boundary

Looking at other aspects, ...

✈️ — Inefficient cross-boundary operation due to the ops/tech gaps

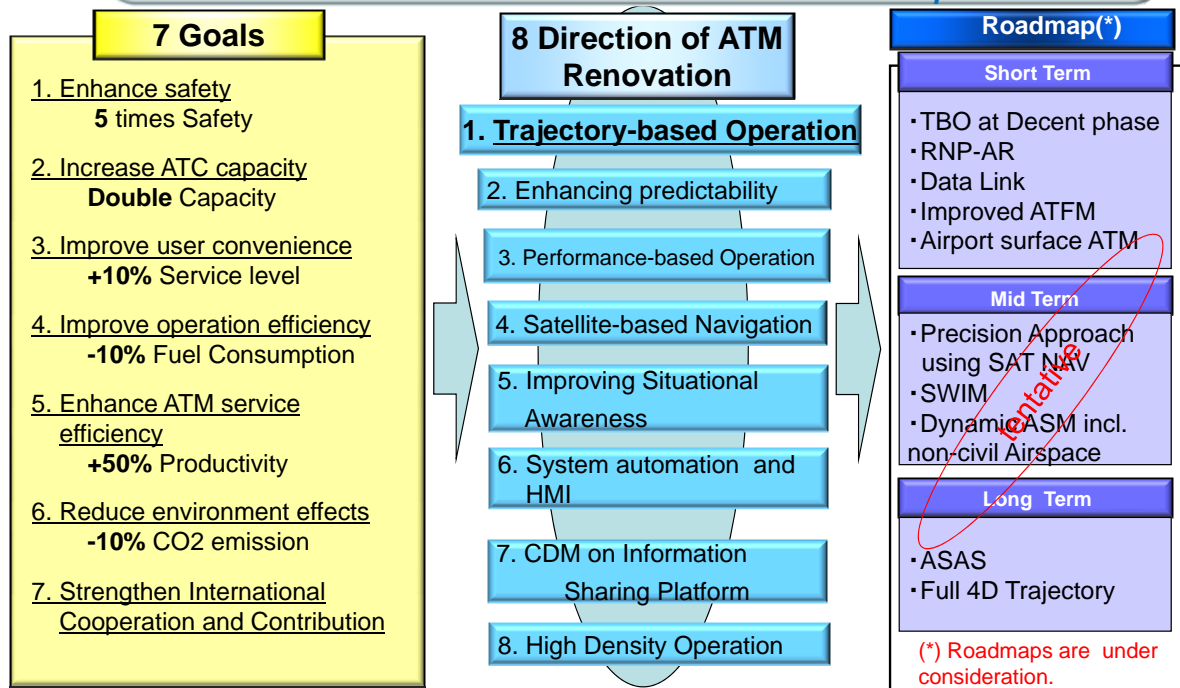

Restricted routes → ✈️
and procedures due to the tech/topographical constraints

Features: What's "CARATS" in short?

- ✈️ — A long-term vision, foreseeing at 2025 and beyond
- ✈️ — A product thru collaborative work among ATM stakeholders
- ✈️ — Aiming at performance-based ATM system with clear targets
- ✈️ — Encompassing wide actors and systems, including airborne
- ✈️ — Stepped approach based on roadmaps
- ✈️ — Performance review and goal achievement analysis

Structure: What does "CARATS" comprise?

Example:
Goal 1: Safety Enhancement

numerical target

Enhanced Level of Safety (5 times safety)

While air traffic volume is forecast to increase by 1.5 times in 2025, the air traffic systems should reduce the number of aircraft accidents at least by half.

➡ $(1.5 \times 1.5) \times 2 = 4.5$ Round-up ➡ 5.0

descriptive goal

- “**Safety**” continues to be a major prerequisite in designing and establishing the future air traffic systems.
- Focus on the countermeasures against accidents attributable to **human errors, meteorological factor, inadequacy of information sharing among stakeholders and lack of situational awareness.**
- In terms of crisis management, **security measures and contingency measures** must be secured to provide continuous and stable AN services.
- For continuity of operation, the systems should be designed with **high reliability** and **invulnerability** against external factors.

Civil Aviation Bureau Japan

ATM renovation supported by CNS innovation to achieve “seven goals” by overcoming the existing constraints .

8-pillared renovation

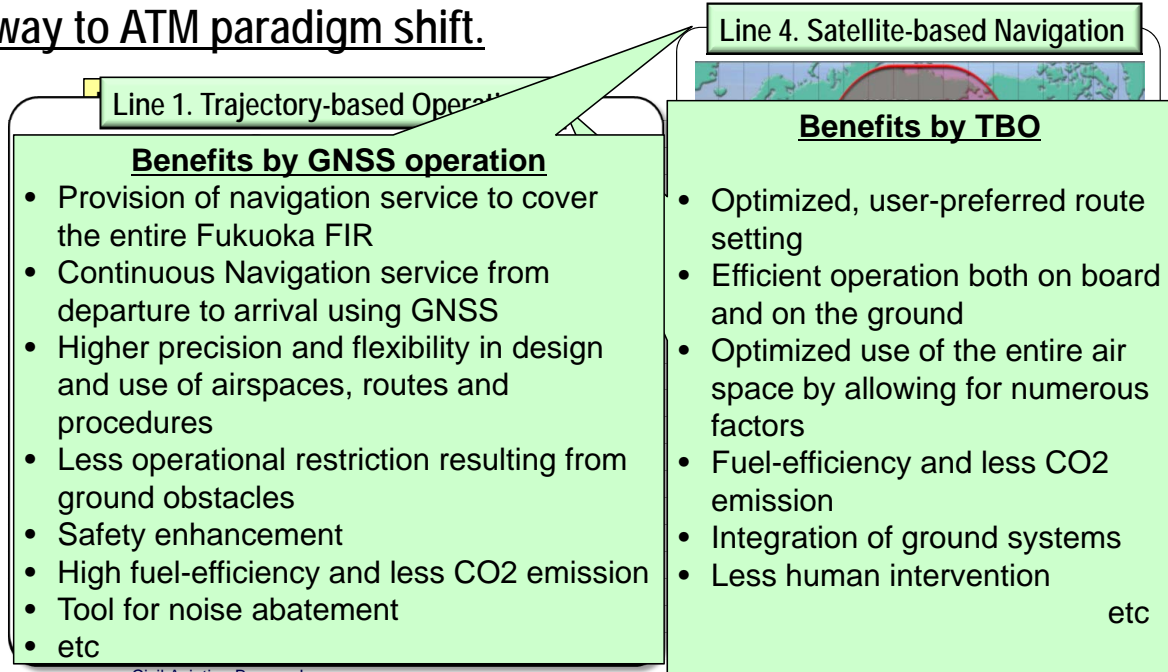

1. Realization of trajectory-based operation (TBO)
2. Improving predictability in ATM
3. Promoting performance-based operation (PBO)
4. Development of satellite-based navigation during all flight phases
5. Adequate situational awareness in the air and on the ground
6. Maximum application of human and machine capability, on the platform of automated ATM systems
7. Information sharing and collaborative decision making(CDM on SWIM Platform)
8. Attainment of high-density operation in congested airspaces and at airports

Civil Aviation Bureau Japan

6. Directions of ATM Renovation (2)

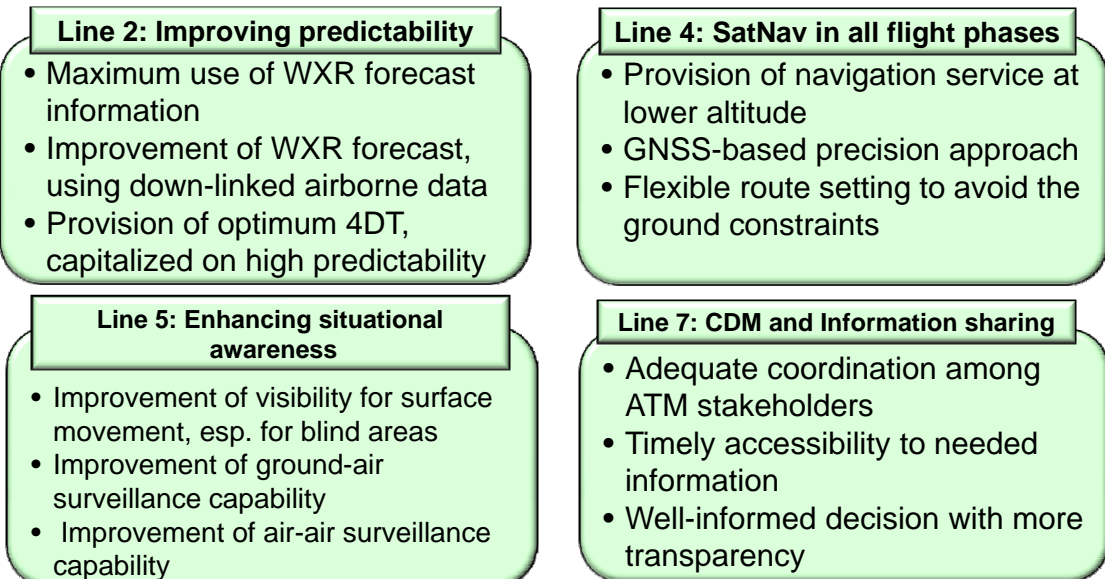

With "TBO" as a core element, 8 lines of renovation will pave the way to ATM paradigm shift.

6. Directions of ATM Renovation (3)

Toward "Safety" goal, the following items, not limited to these, are operational improvement under each line.

Example: Safety Enhancement (Goal 1) and relevant renovation

7. Work plan of 2010 (1)

P18

So far, a vision on future ATM has been blueprinted.
In FY2010, "CARATS Promotion Committee" will ...

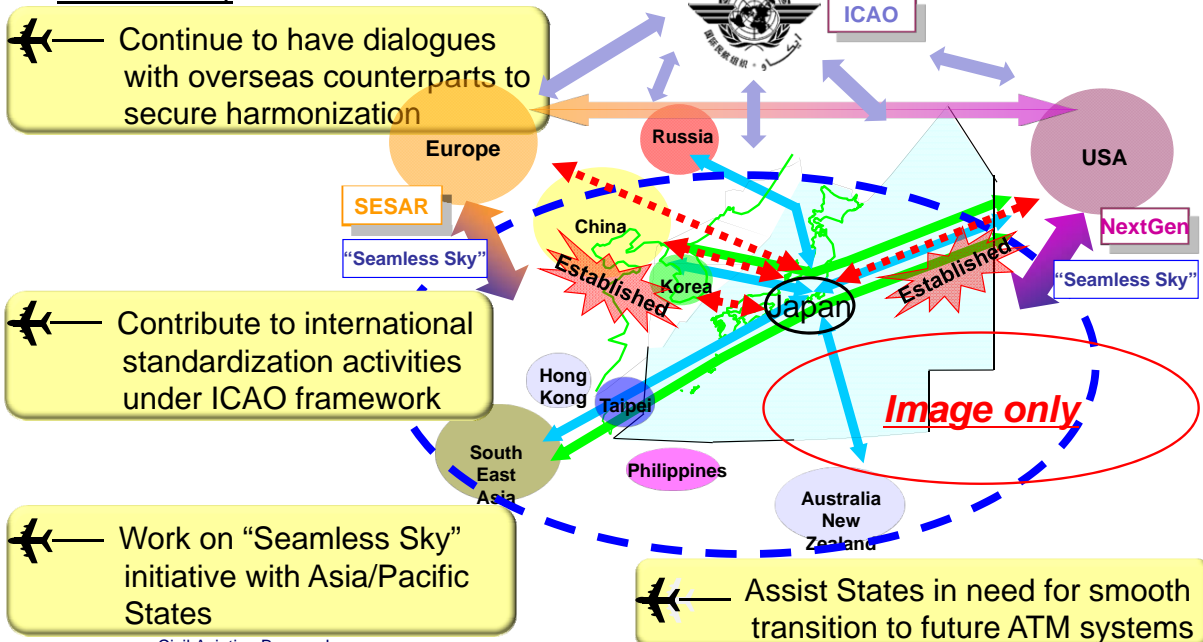

- ✈️ — Lay out a roadmap, representing step-by-step implementation of the measures required to build the future air traffic systems.
- ✈️ — Clarify the roles of the industry, academy and government partners.
- ✈️ — Study and set indices for achievement analysis of numerical targets .
- ✈️ — Consider a framework, as necessary, to ensure the steady implementation of the mapped measures.

Civil Aviation Bureau Japan

7. Work plan of 2010 (2)

P19

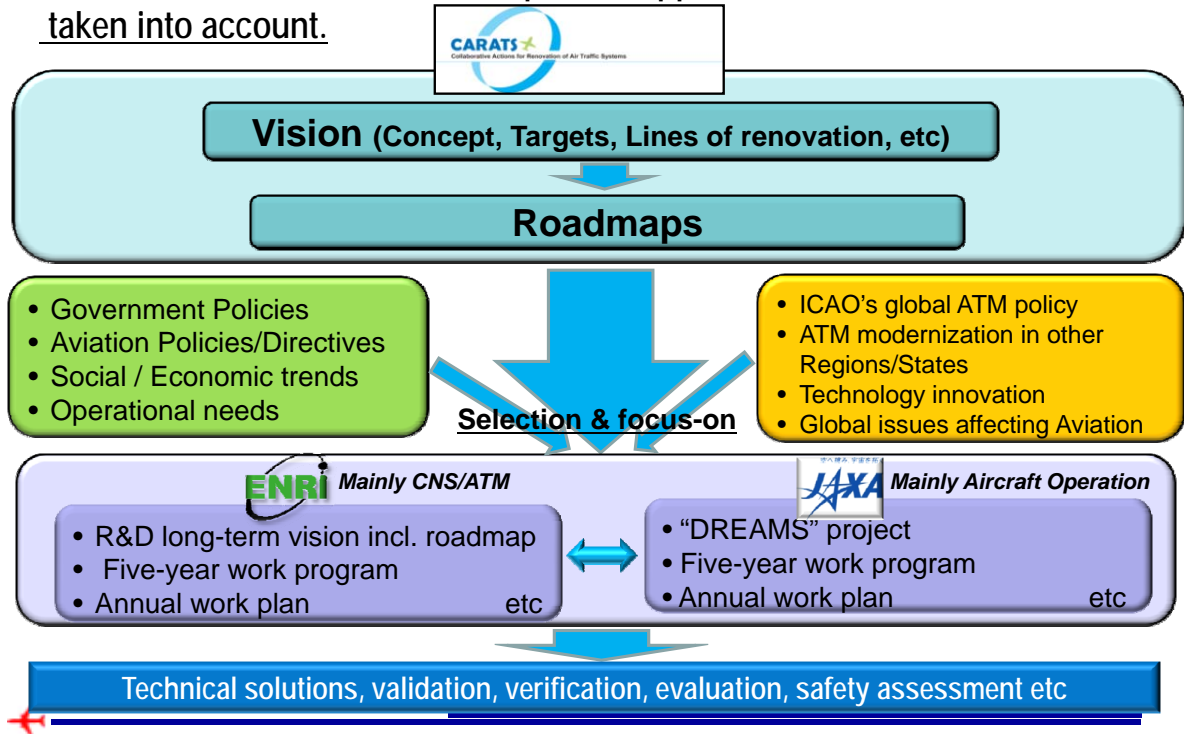

To ensure our future system be interoperable with others,
we will...

Civil Aviation Bureau Japan

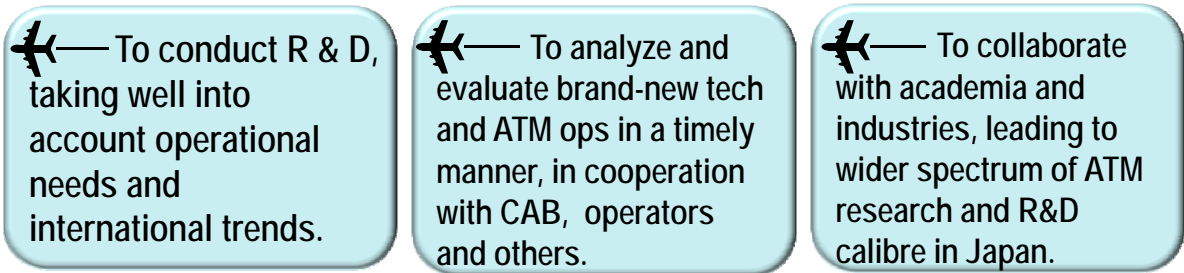

8. R&D aspect in CARATS (1)

R&D will also be undertaken in a phased approach with external factors taken into account.

8. R&D aspect in CARATS (2)

Under CARATS vision, expectations to research institutes are:

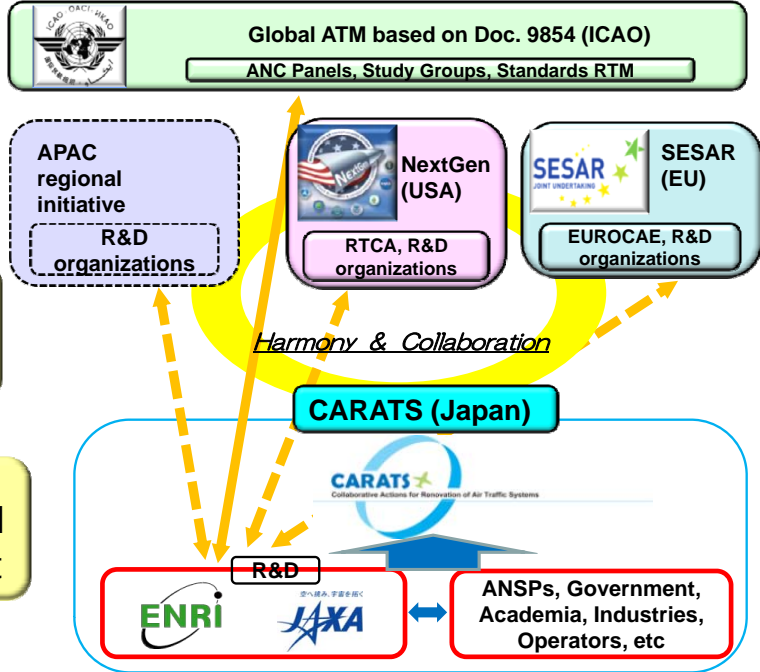

Effective and efficient role playing to be laid out over a long span.

	Planning	R & D	Standardization	Development	Implementation	Operation
ANSP	•Leading •Policy making	•Request •Support	•Leading •Legislation	•Regulation •Procedures •Manuals	•Implementa- tion	•Operational evaluation
Research Institutes	• Proposal • Needs finding	• R & D	•Participation	•Safety Assessment •Validation	•Support to implemen- taion	•Support to evaluation
Operators	•Needs presentation	•Request •Support	•Participation	•Procedures •Manuals	•Equipage	•Operational evaluation

Note: The above table is an example only, does not constitutes CARATS vision. Involvement of academia and industries are subject to individual cases.

R&D institutes are expected to play significant roles in forging a global ATM by :

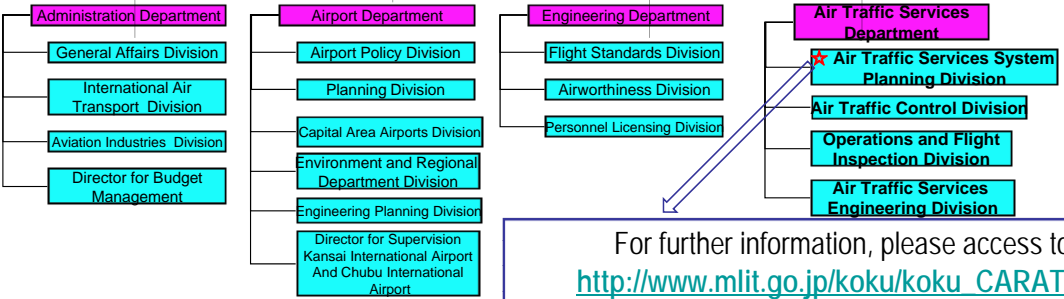

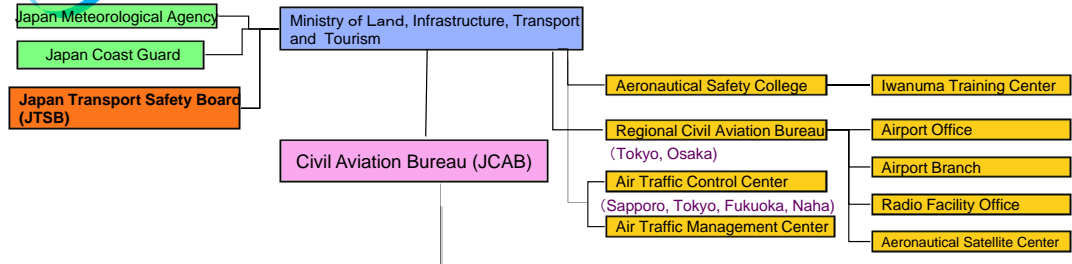

-  Involvement and contribution to int'l standards making.
-  Cooperative work with R&D entities of other projects
-  Keeping abreast with the tech evolution and proactive involvement
