

ENRI International Workshop on ATM/ CNS

Applying Cognitive Work Analysis to Study Airport-Collaborative Decision Making

PhD Research Project

Matthias Groppe
CRANFIELD University
m.groppe@cranfield.ac.uk

ENRI Tokyo, JAPAN

5 March 2009

Sponsored by
EUROCONTROL & FRAPORT

EUROCONTROL

Outline

- **Introduction to Airport Collaborative Decision Making (A-CDM)**
- **The A-CDM Environment**
- **Objectives of the Research Project**
- **Method of Applied Cognitive Work Analysis**
- **Data Collection & Initial Results**
- **Conclusion**

The Challenge

One Process

Arrival – Turn-round – Departure
Link airports to the Air Traffic Management Network

Requirements

Create transparent overview by Sharing Information
All Airport partners needed for CDM success
Mutual Understanding of operations
Culture change and process improvement

The Airport CDM Concept Elements

Collaborative Management of Flight Updates

CDM in Adverse Conditions

Collaborative Predeparture Sequence

Variable Taxi Time Calculation

The Milestones Approach

Airport CDM Information Sharing

Information Sharing & Milestone Approach

Principle

Foundation for CDM

Right info → Right Time → Right People

Requirement

One Common Information Platform is required

Develop procedures and actions for each milestone

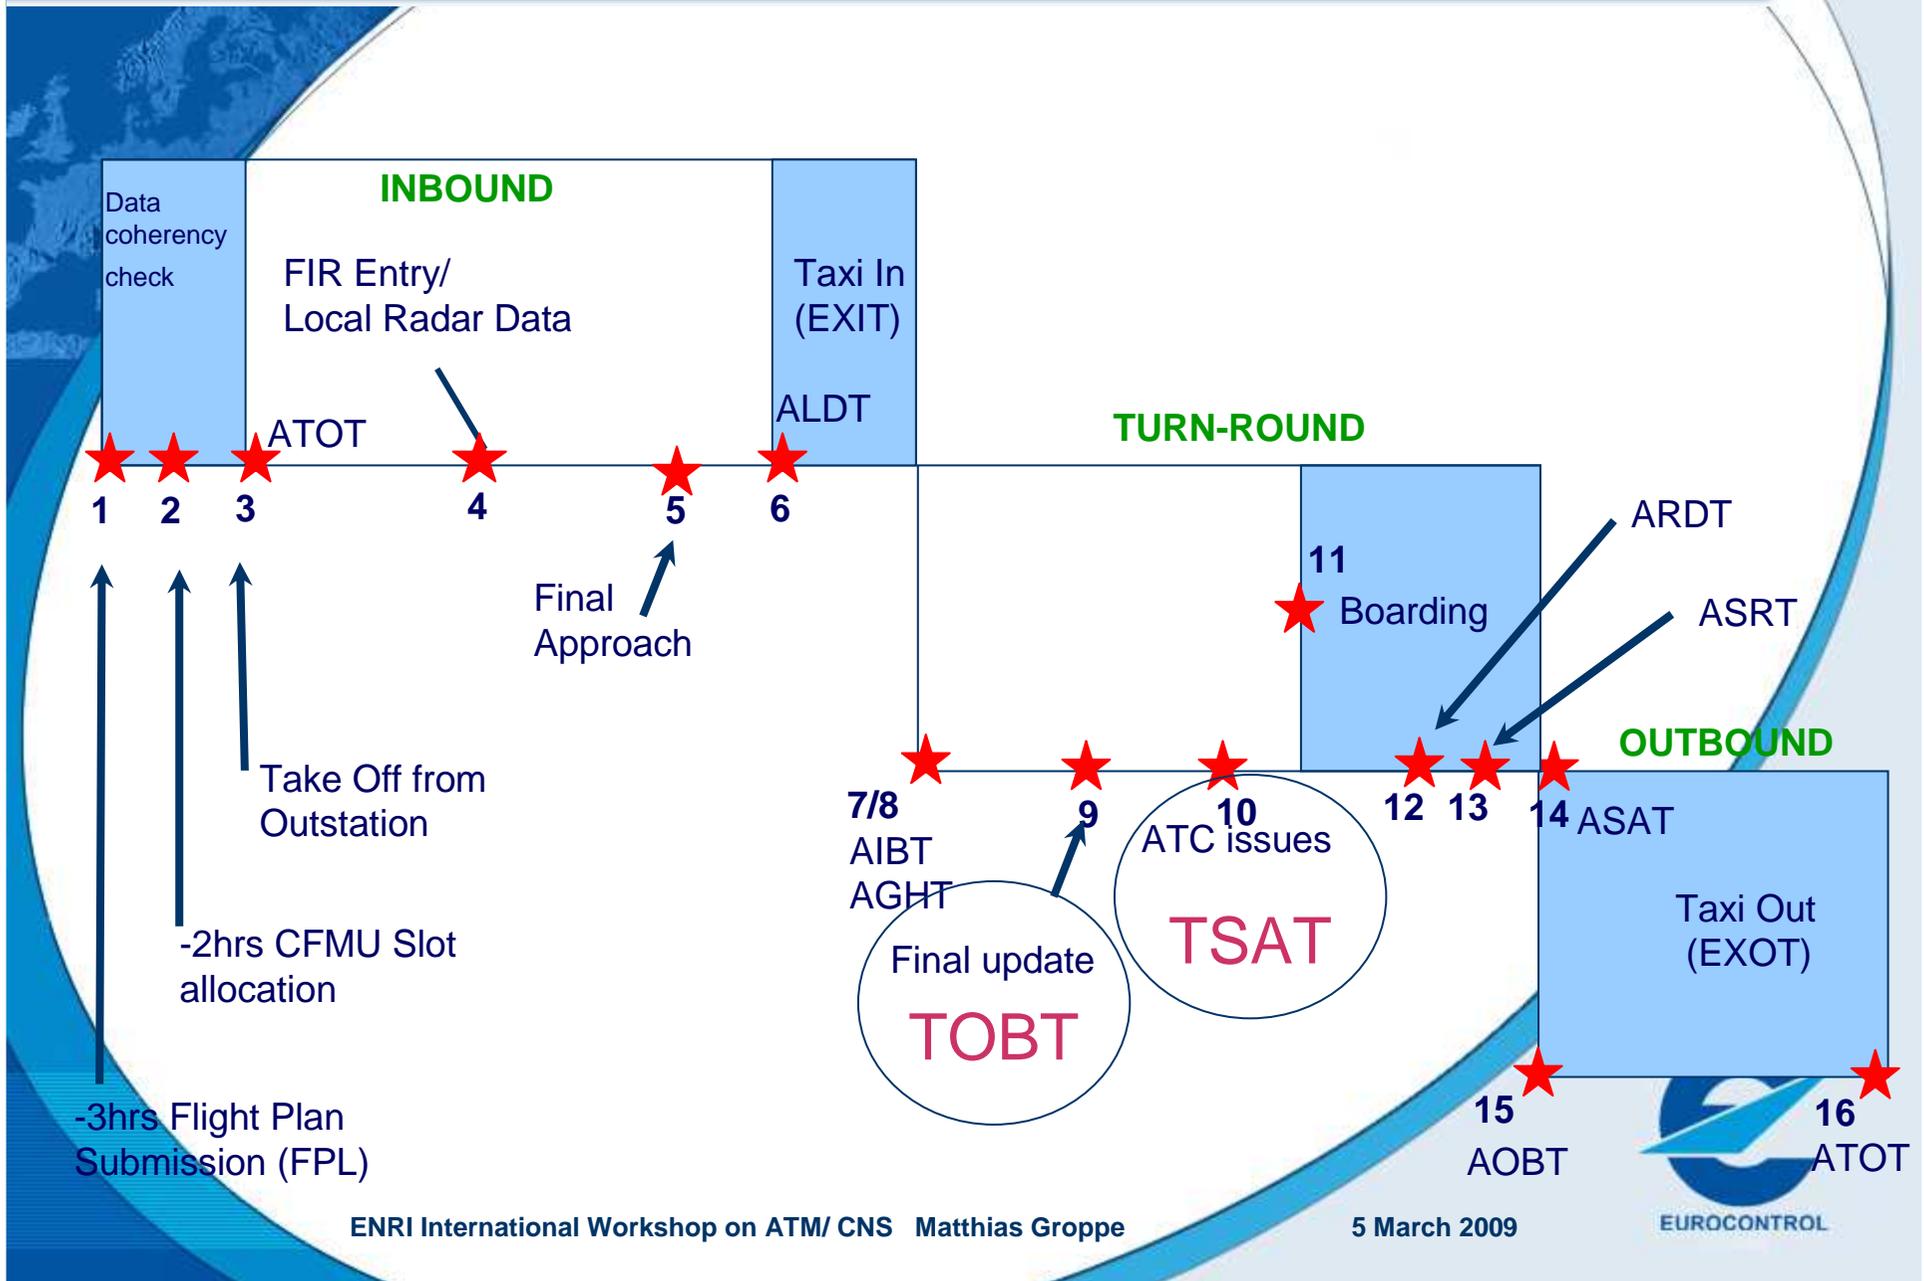

Benefits

Brings partners together → Promotes trust

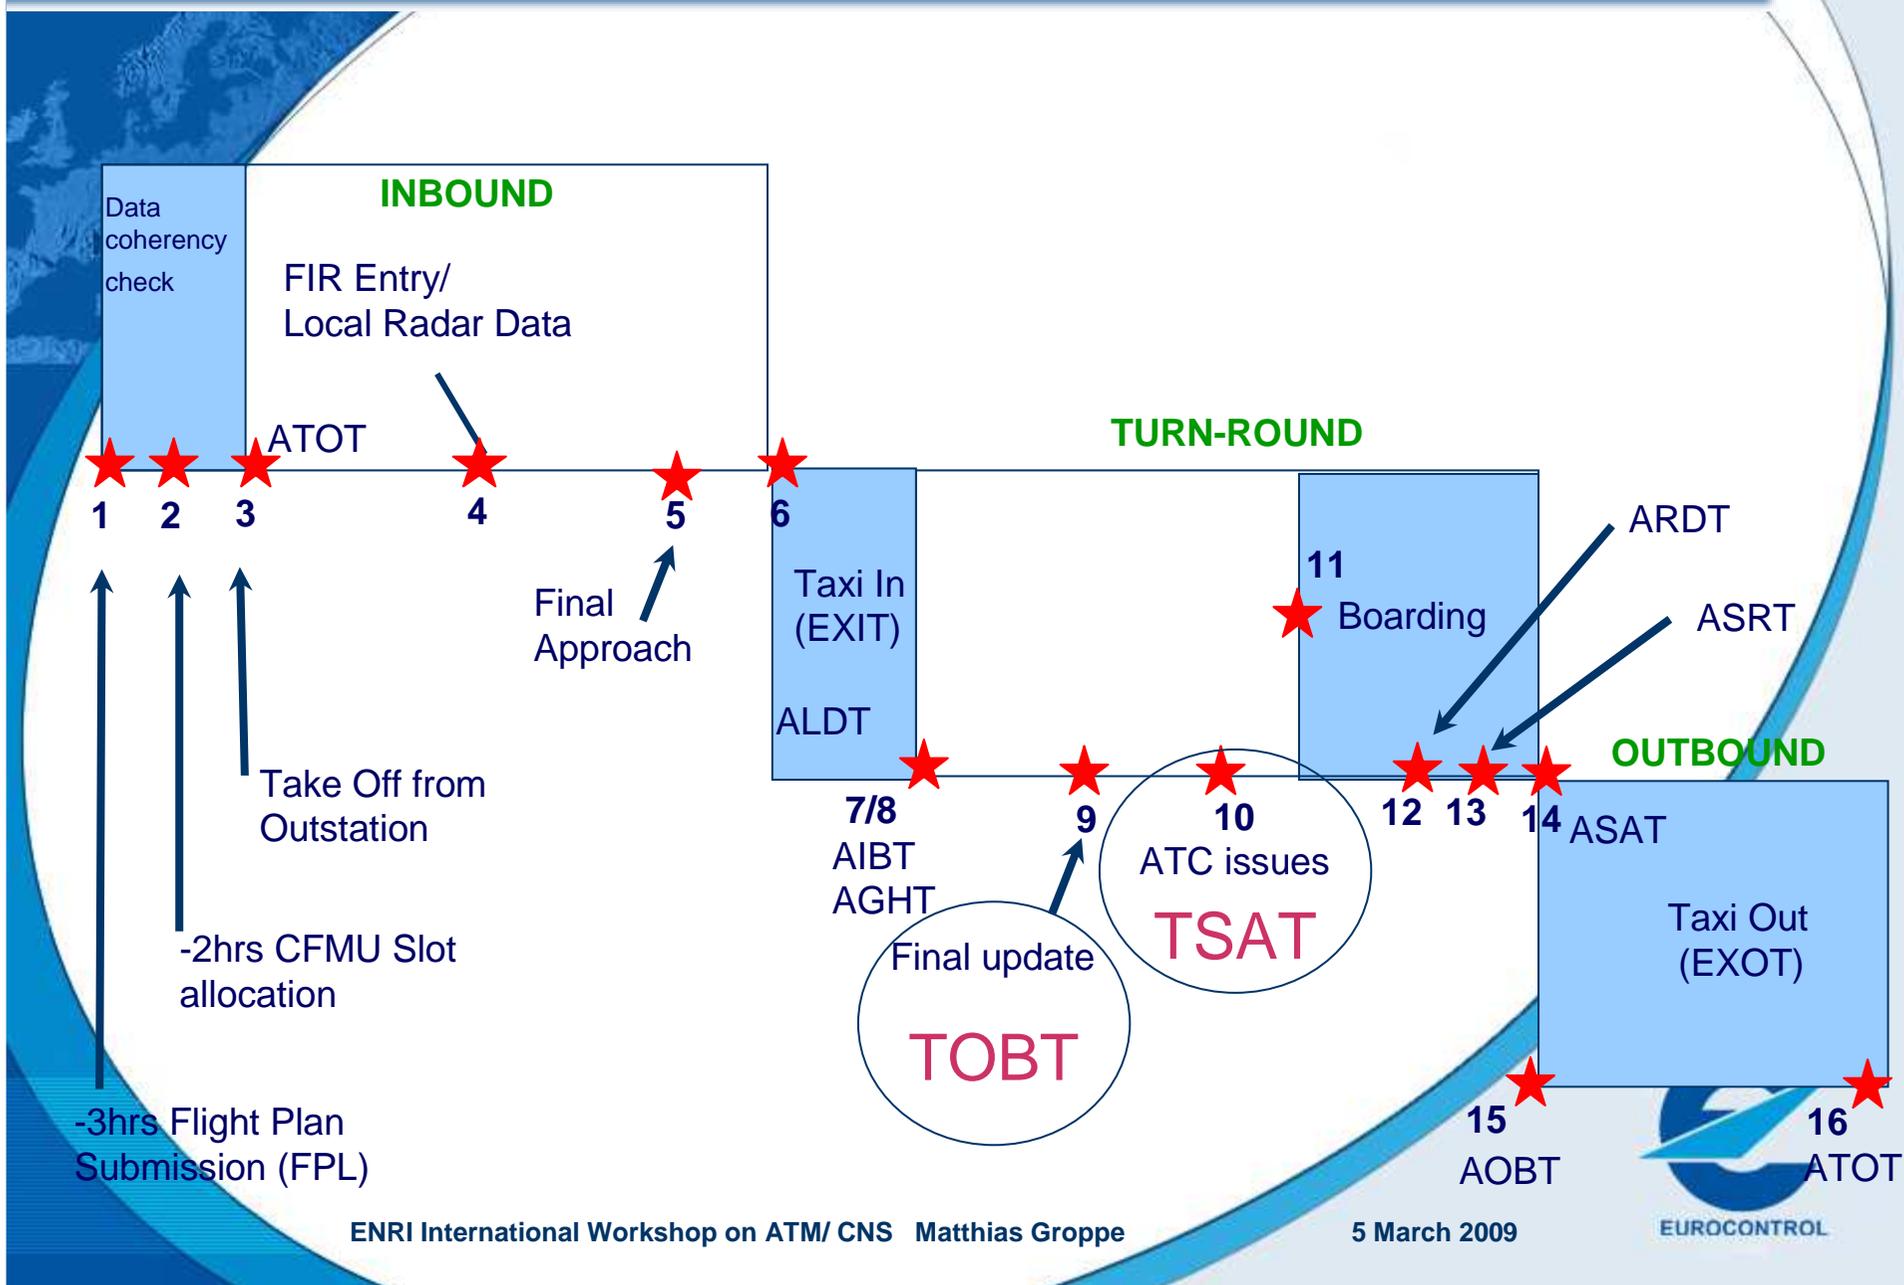

Common situational awareness → efficient use of resources

Improved predictability → maximises operational efficiency

Airport CDM Key Milestones – TOBT & TSAT

Airport CDM Key Milestones – TOBT & TSAT

Airport CDM Key Milestones – TOBT & TSAT

TOBT (Target Of Block Time)

*The time that an **aircraft operator / handling agent** estimates that an aircraft will be ready, all doors closed, boarding bridge removed, push back vehicle available, ready to start up / push back immediately upon reception of clearance from the TWR.*

TSAT (Target Start Approval Time)

*The time **provided by ATC** taking into account TOBT, CTOT and / or the traffic situation that an aircraft can expect to receive start-up / pushback approval (when start-up and pushback are issued together)*

Benefits for Airport Partners

- Improved infrastructure usage
- Reduced ATCO workload with enhanced planning
- Reduced Apron and Taxiway congestion
- Improved airport image (passengers perception of smooth operations)
- Better situational awareness during times of disruption and delay

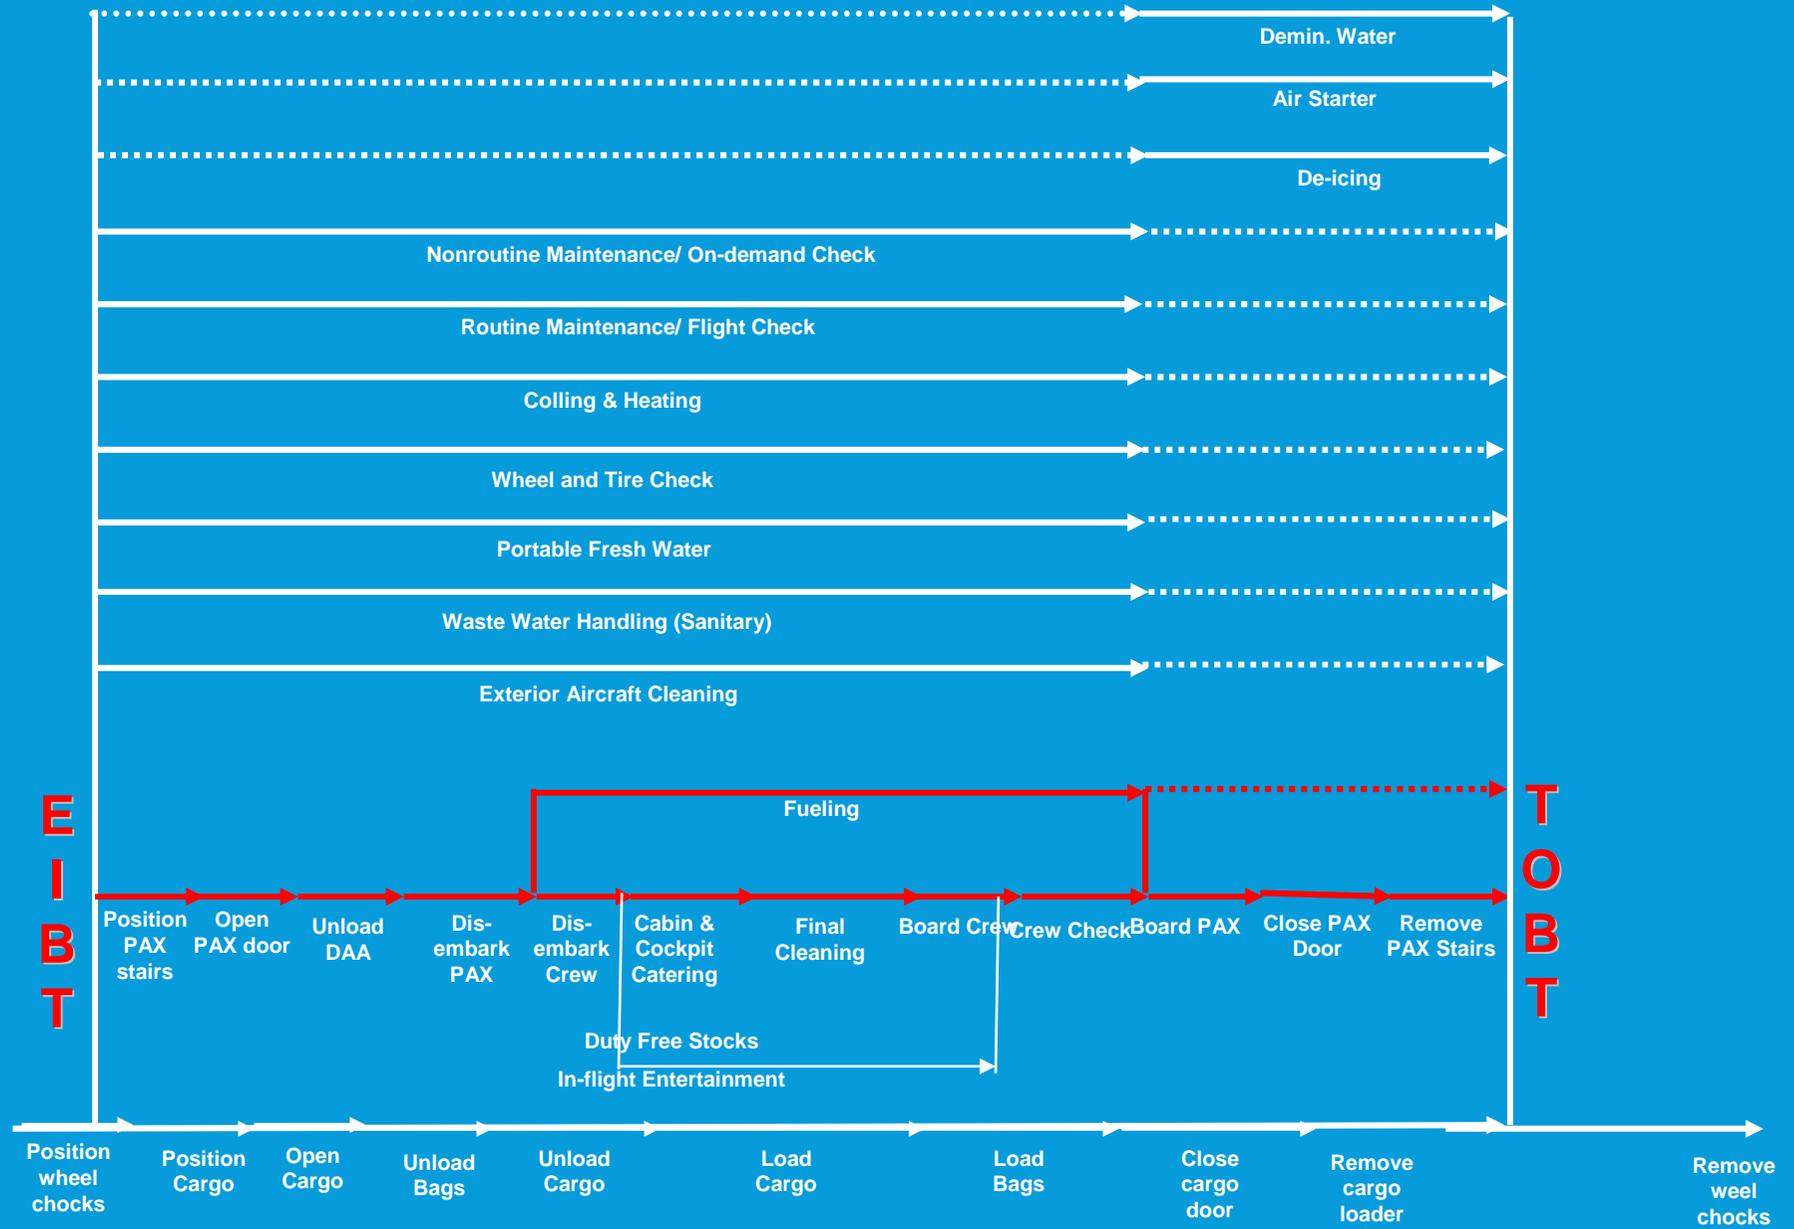

Airport CDM Implementation

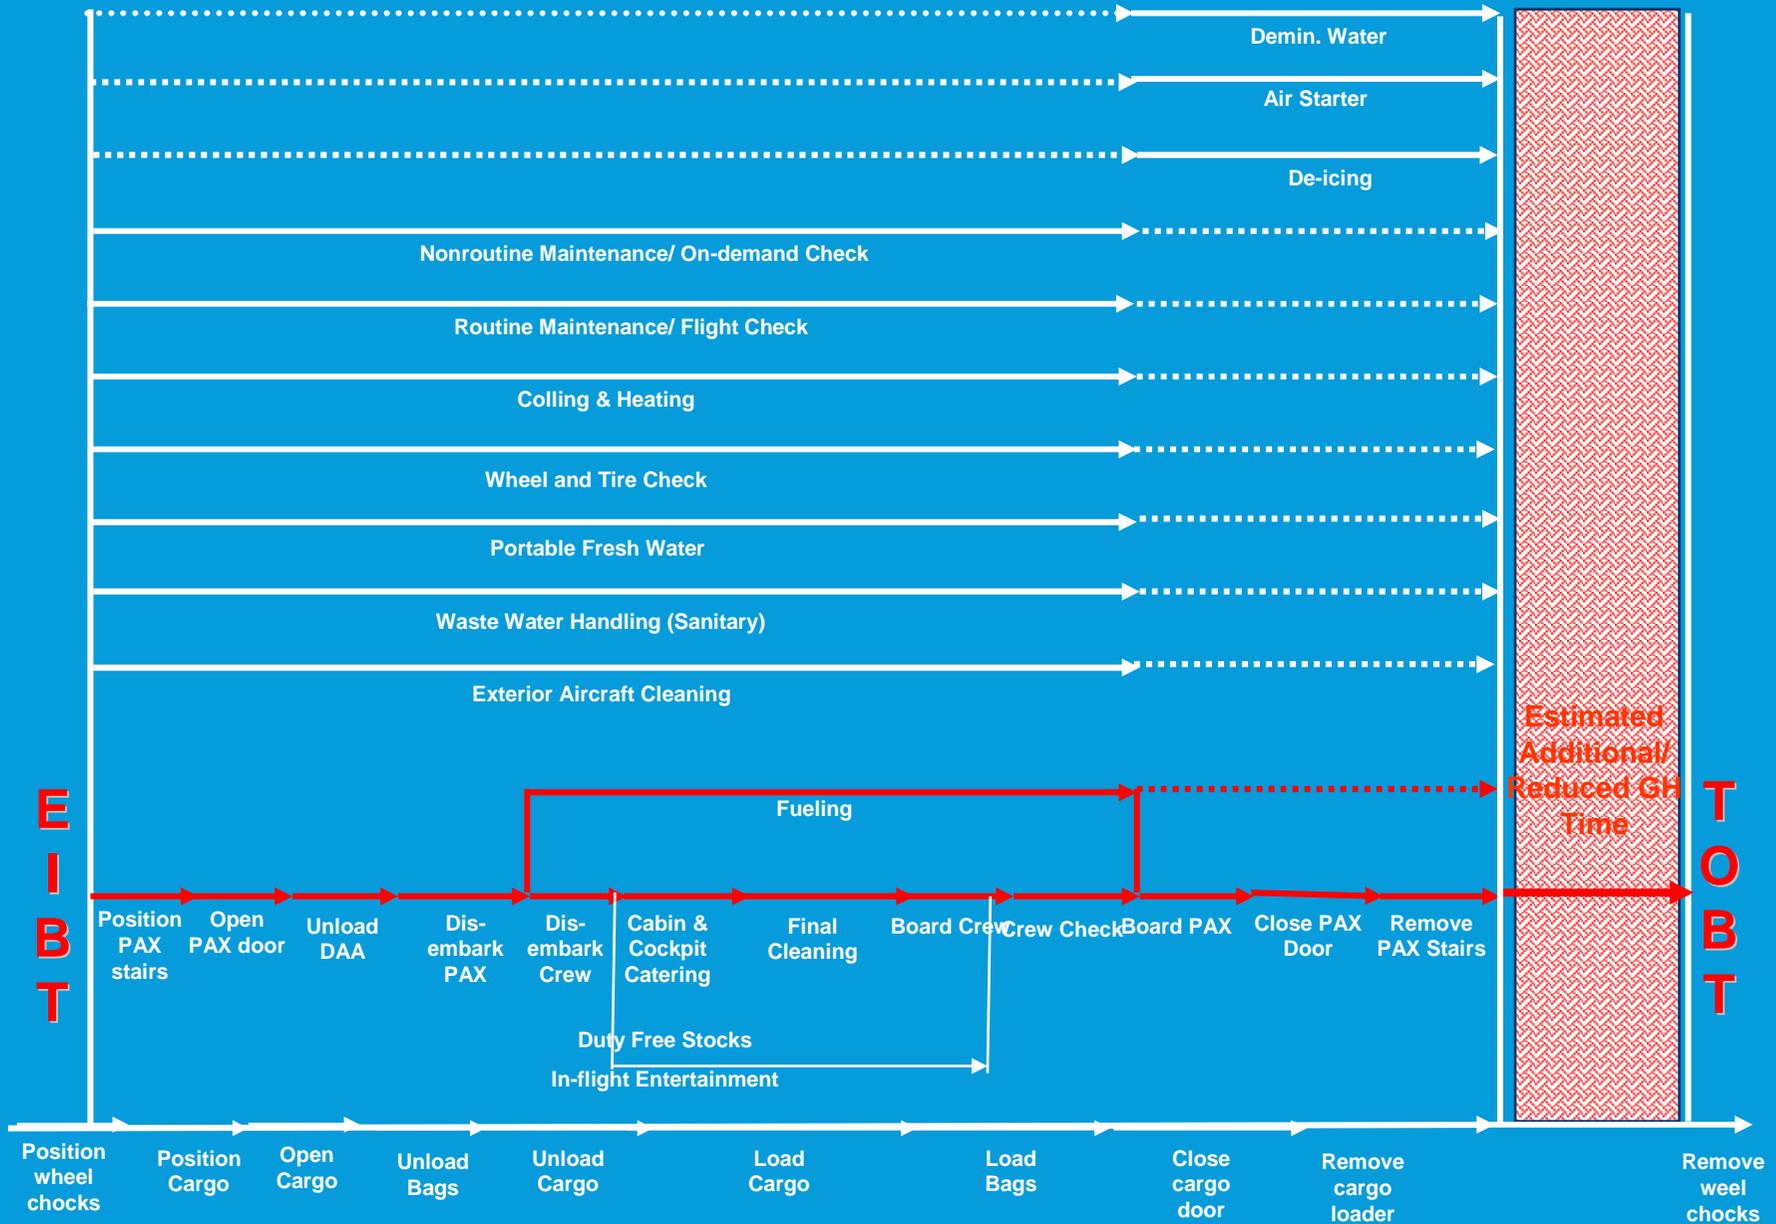

**Over 21 ECAC
Airports
Implementing**

The A-CDM Turn-Round: Critical Path

The A-CDM Turn-Round: Critical Path

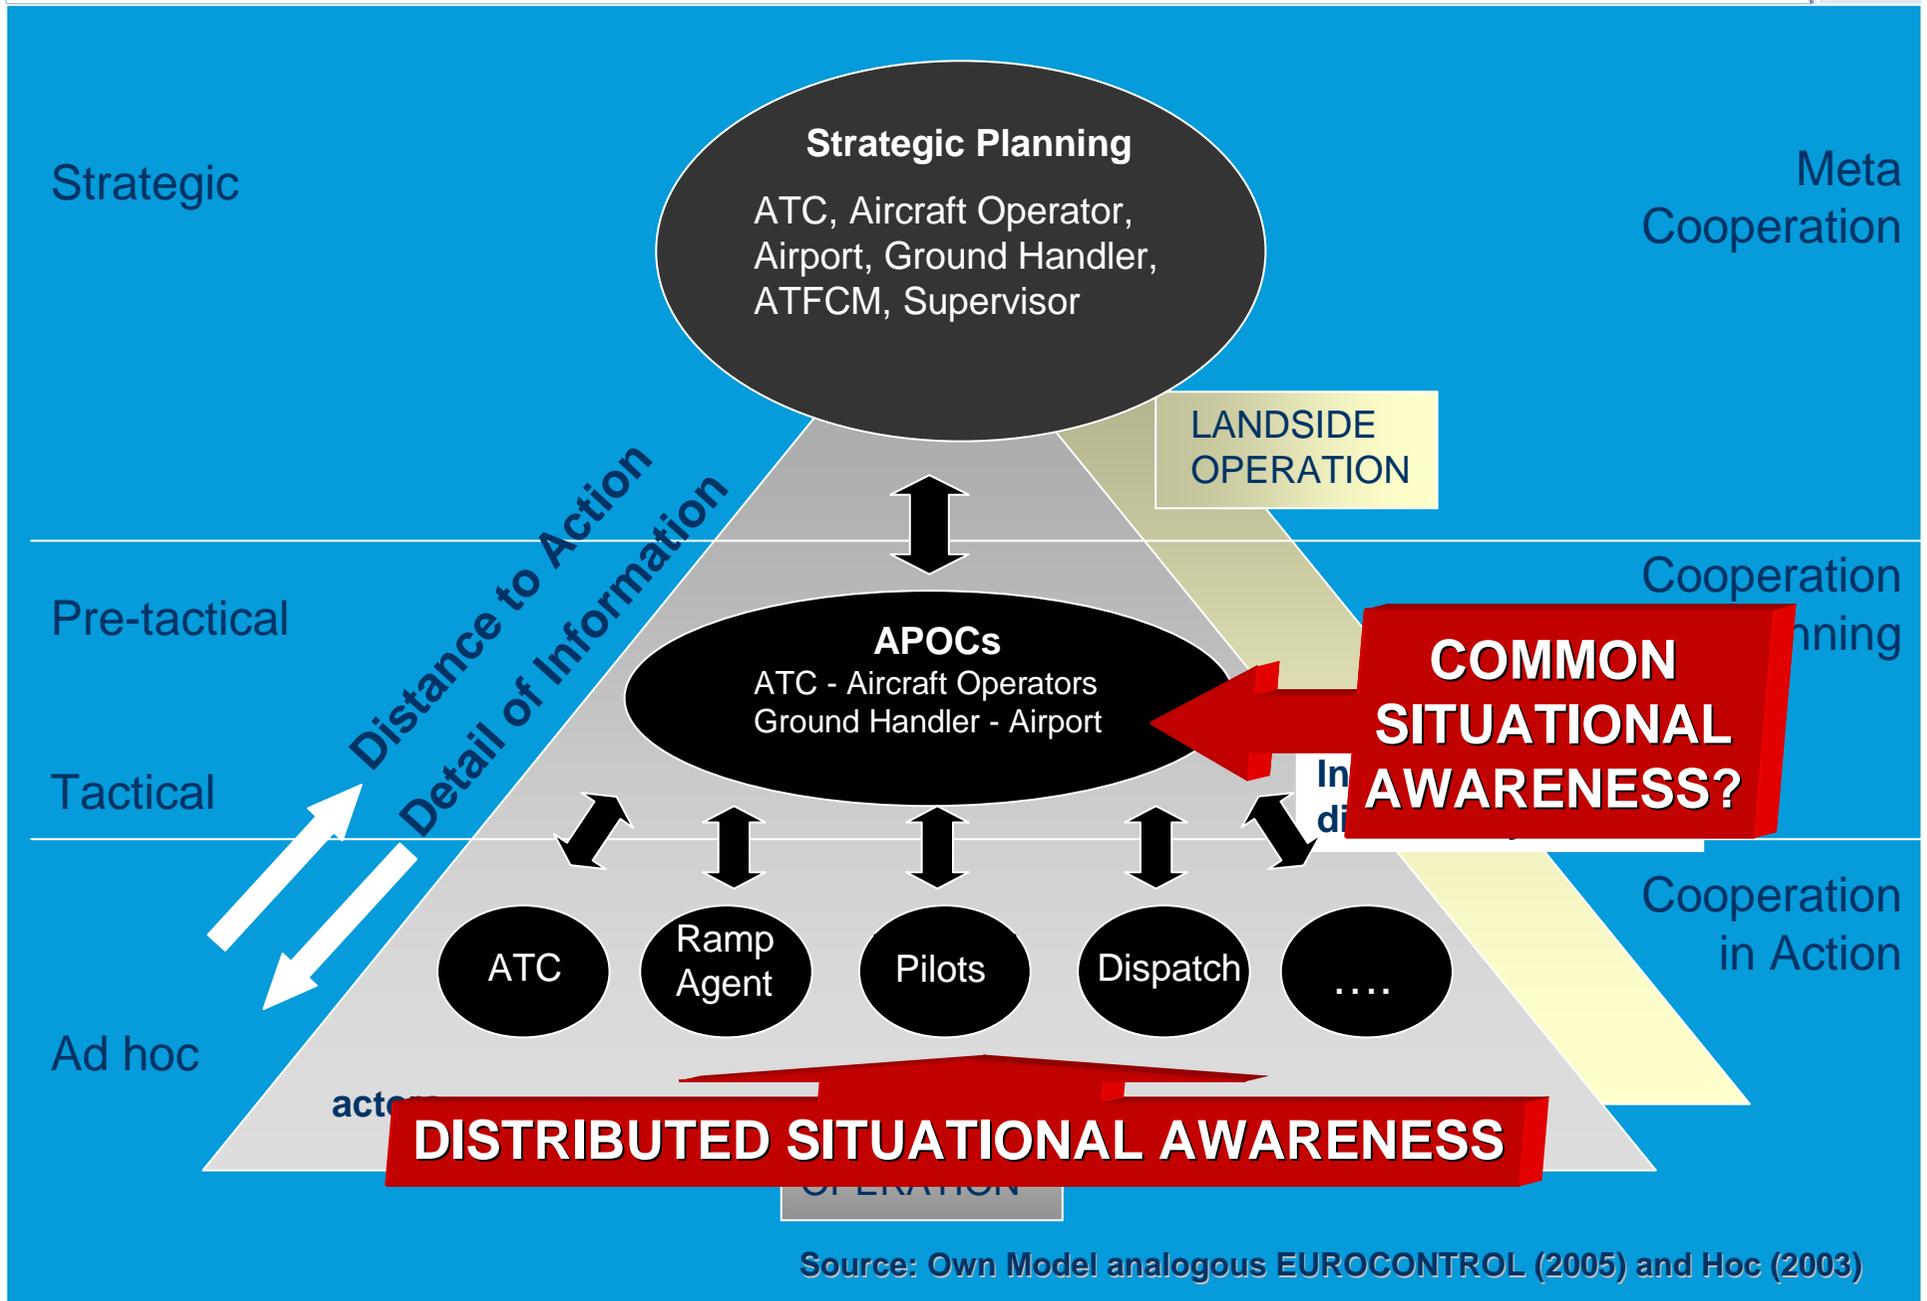

Airport CDM Environment I

- ⊖ Operational decision making is based on *insufficient quality & flow of information* (observation & own experience)
- ⊖ Not all airport partners have required *Situational Awareness* for operational decision making

Airport CDM Environment II

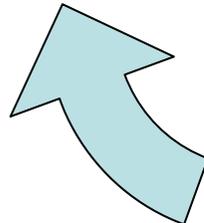

Airport CDM Environment III

APOC: Planning Level

Operational Decision Making

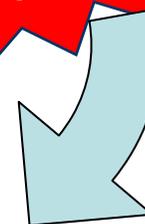

INFORMATION SHARING
- Intermediaries
- Distributed Location
INFORMATION
SYNCHRONISATION
Distance to Planning/ Action

Cockpit: Action Level

Safety related Decision Making with Operational Consequences

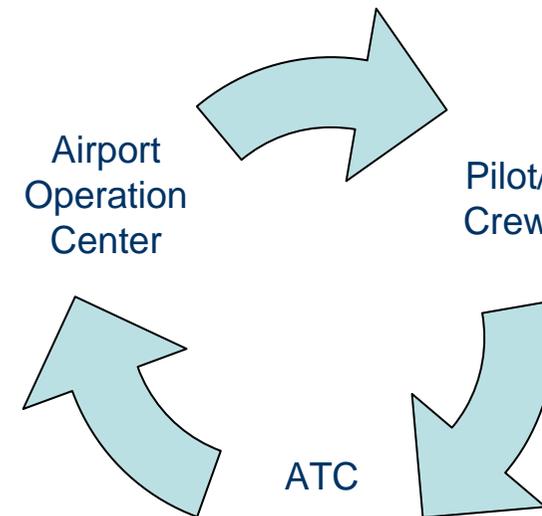

ATC Tower: Action Level

Project Objective: Improve TOBT Predictability

Context I: Constraints through Multi-Party Decision Making

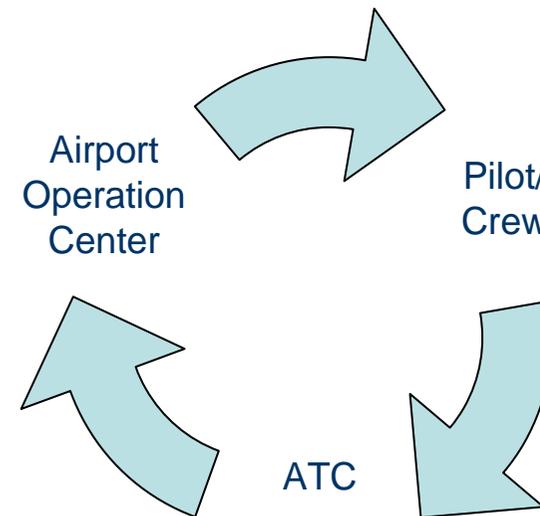

- ☞ Identify *individual (single operator)* goal setting to increase cooperation towards a *common (global)* goal
- ☞ Understand *HHIs* and *HCLs* among operators to increase cooperation building factors

Project Objective: Improve TOBT Predictability

Context II: Heterogeneous & Asynchronous Information Sharing

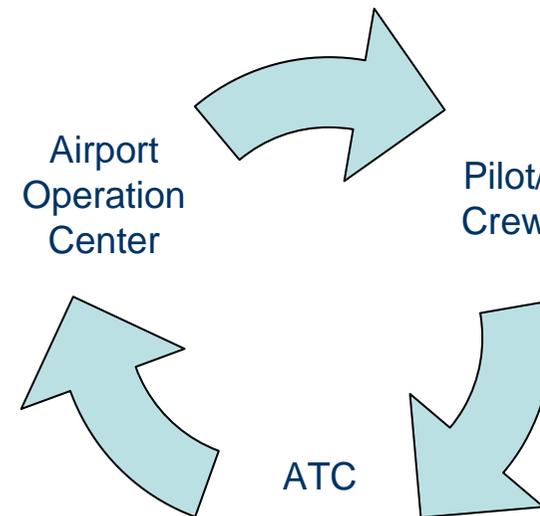

- Identification of *data/information/knowledge components* which should be employed to provide situational awareness
- Synchronization of information sharing for time critical decisions

Project Objective: Improve TOBT Predictability

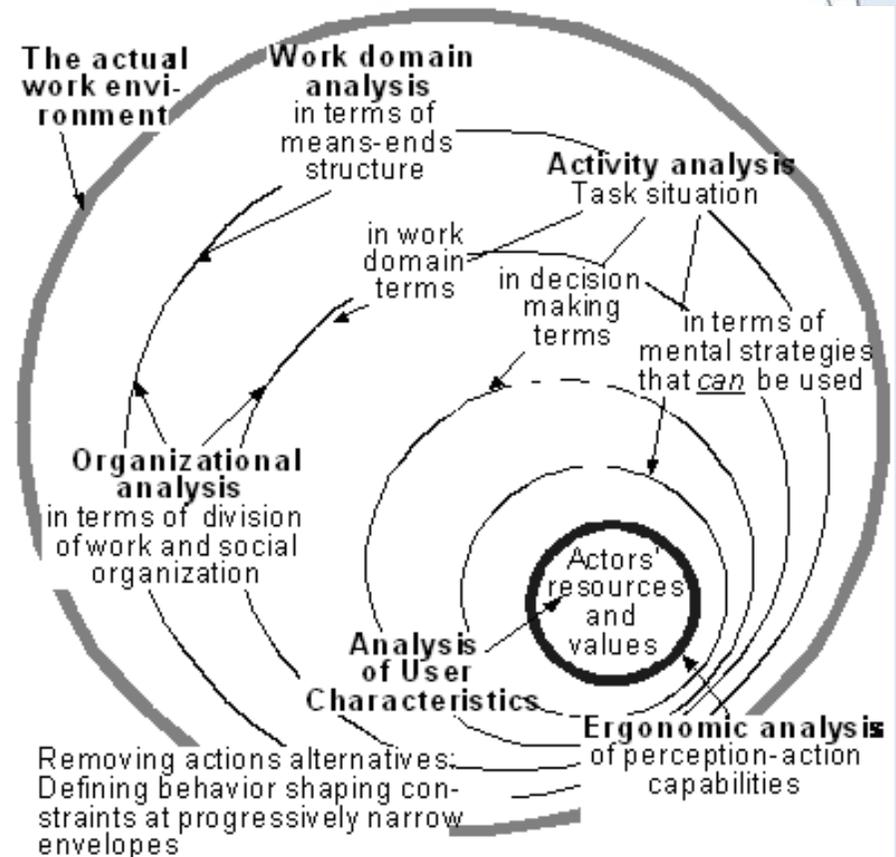

Context III: Irregularities through Unanticipated Events

- Identify *decisions necessary* during unanticipated situations
- Understand *which information* is required for decision making and cooperation among partners during these situations

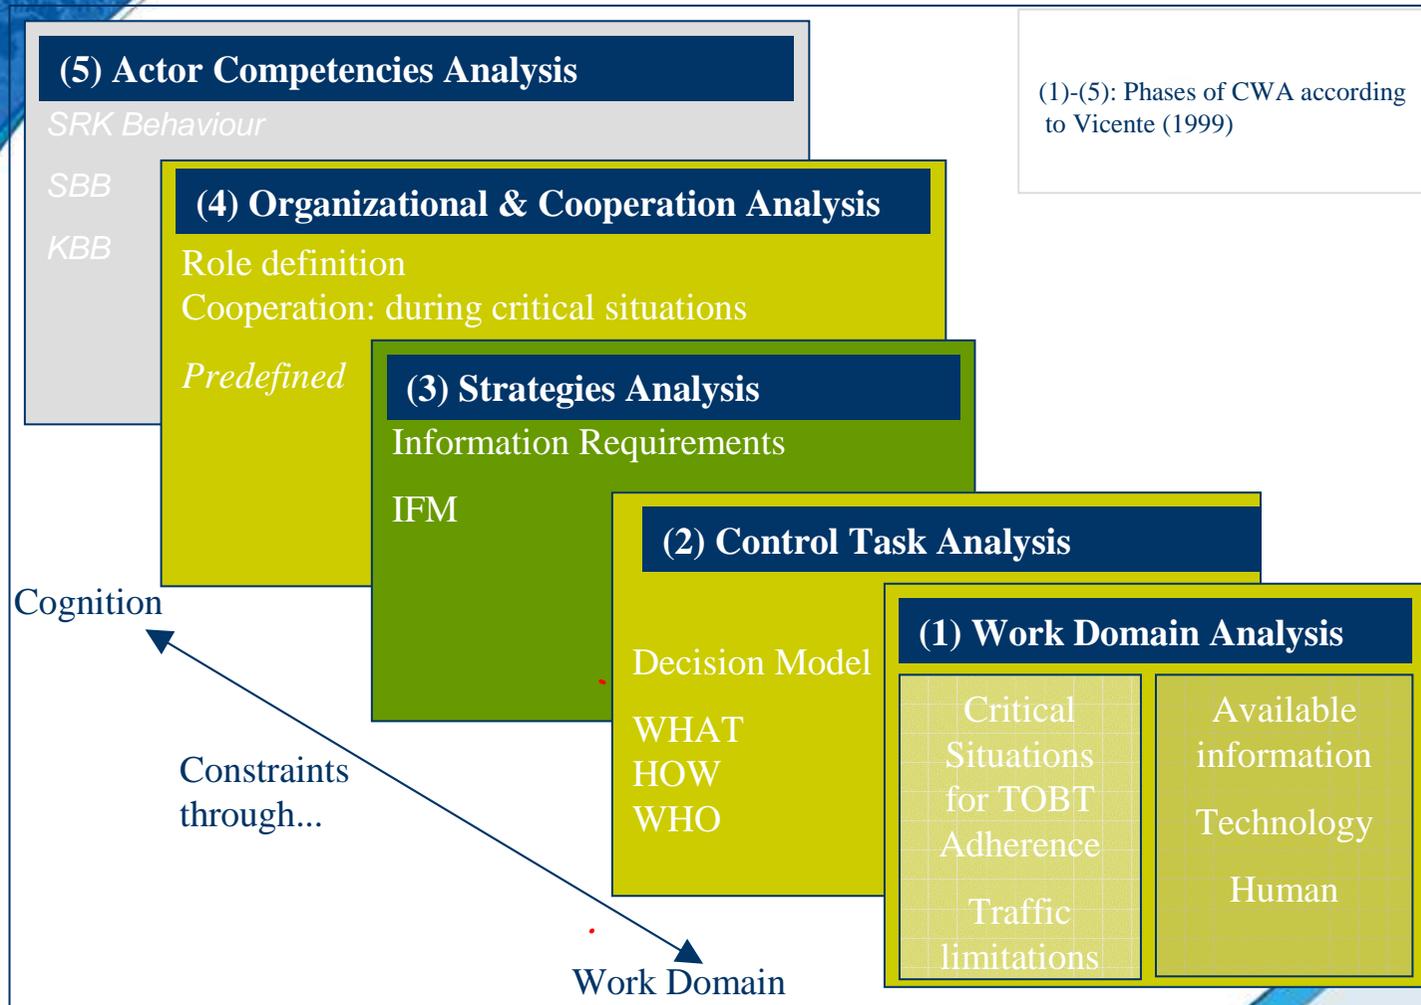

Applying Cognitive Work Analysis I

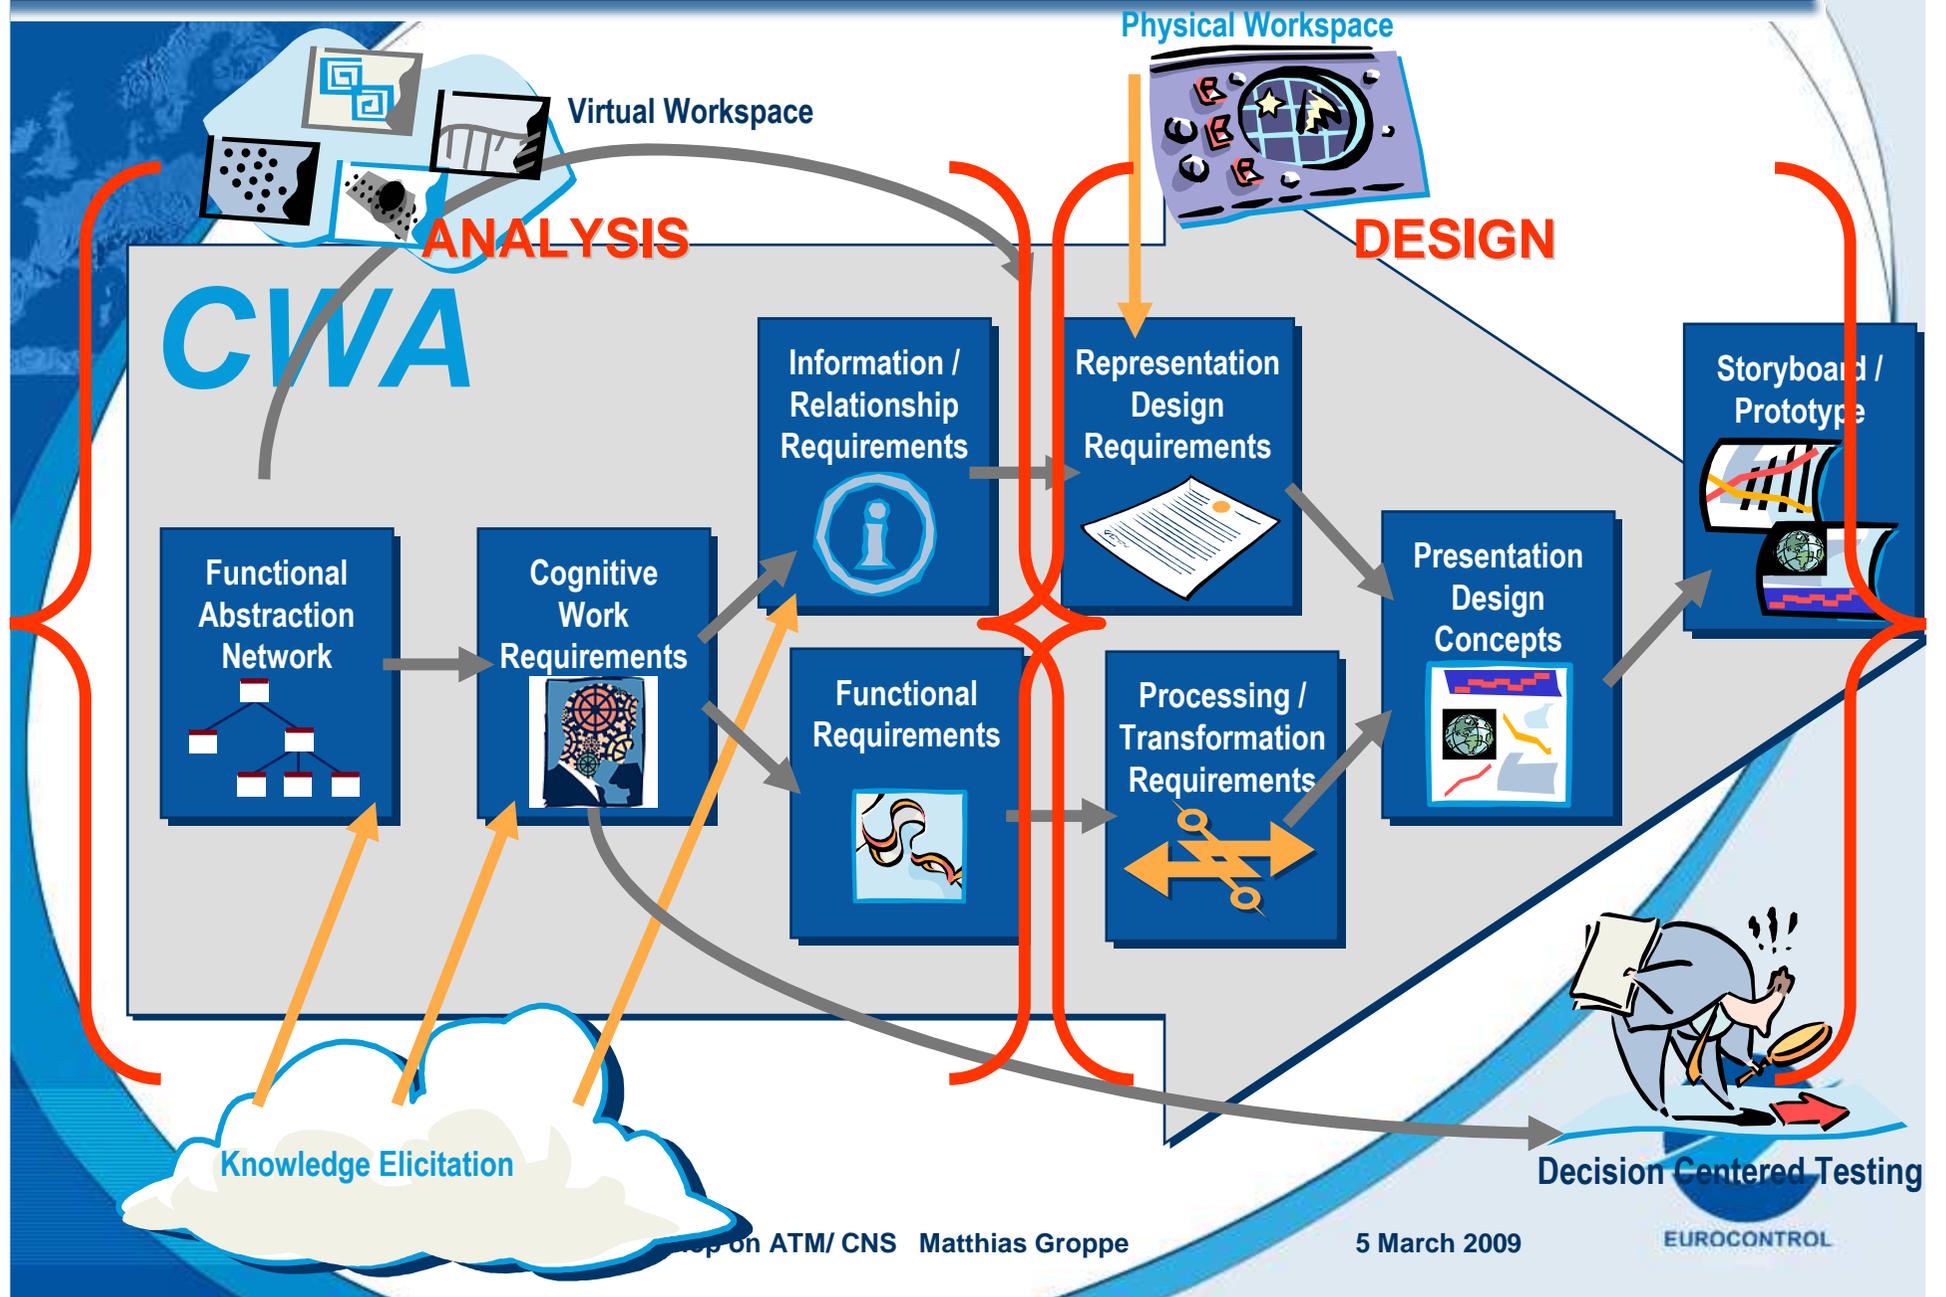

- Analysis, design, and evaluation of complex sociotechnical systems
- Contrast to other task analysis: *Formative* approach
- Designed to provide *decision support* in an environment with different policies, skill sets and capabilities

Applying Cognitive Work Analysis II

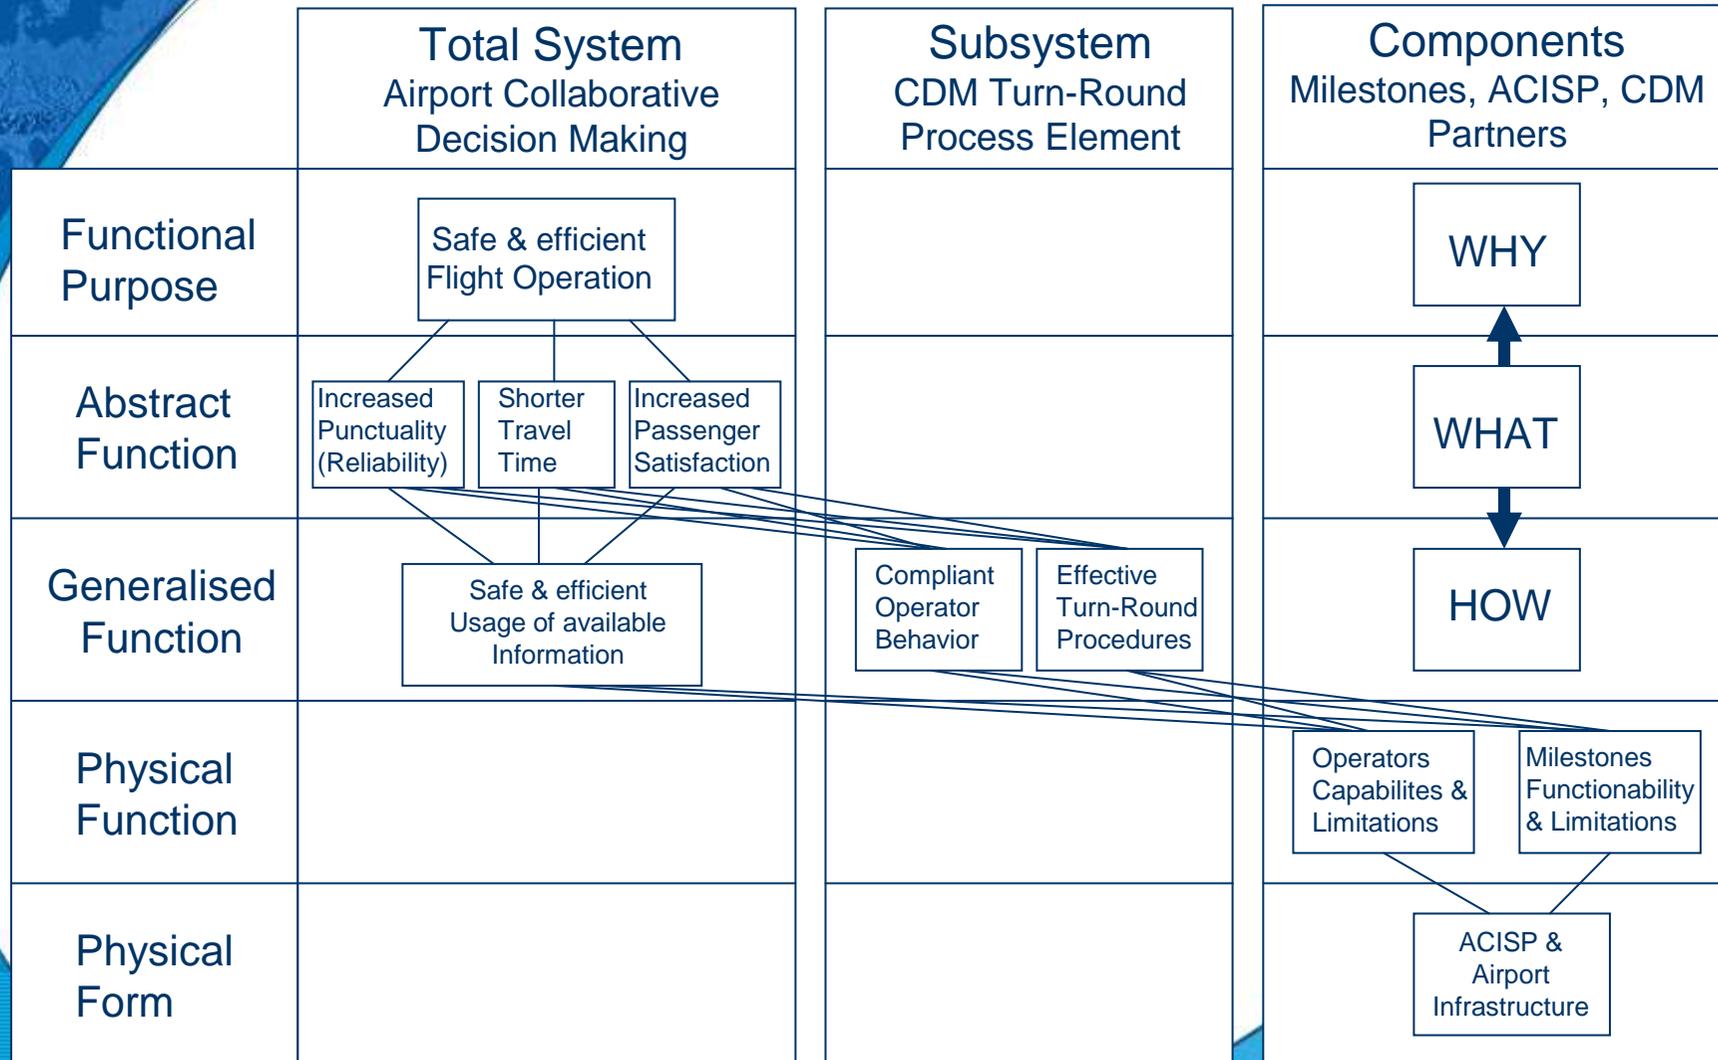

Applying Cognitive Work Analysis II

Airport CDM Turn-Round

(2) Control Task Analysis – The Decision Ladder

(3) Strategy Analysis – Goal Complexity I

[2] Own Model analogous Nezamirad (2004)

(4) Organizational & Cooperation Analysis

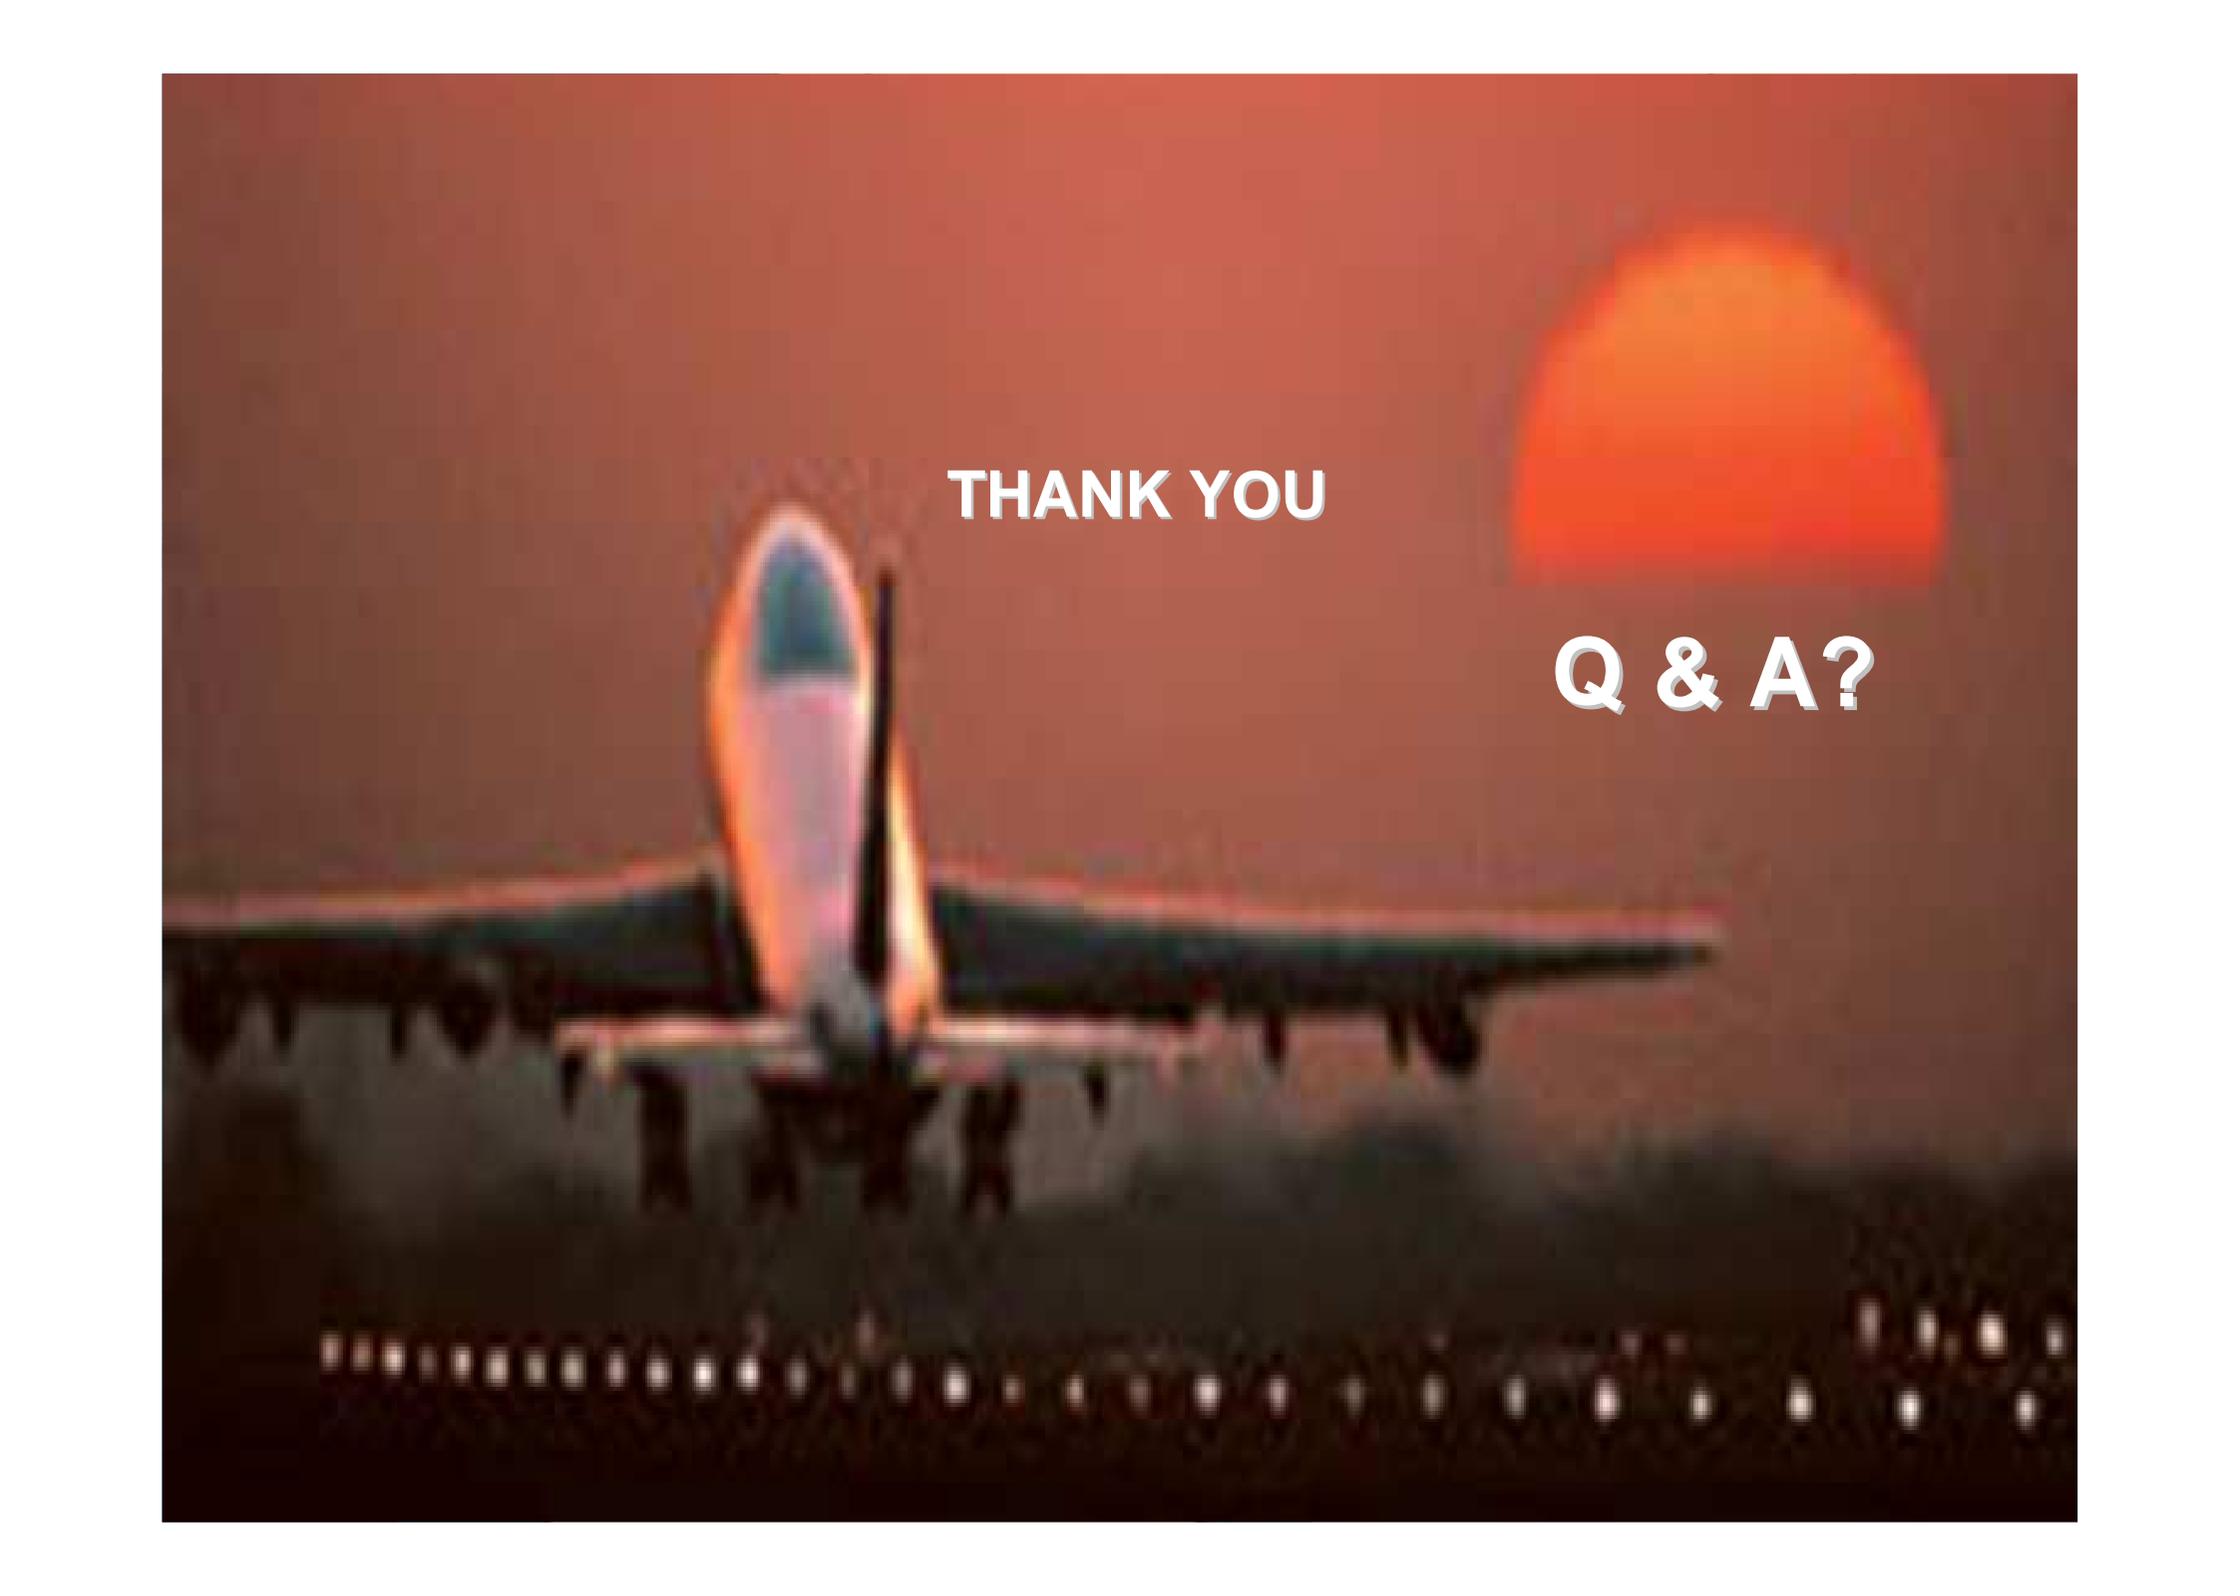

Classification of Interaction Situations (Ferber, 1995)

Aims/ Interests	Ressources	Abilities	Type of Situation	Category
compatible	sufficient	sufficient	Independence	Indifference
compatible	sufficient	insufficient	Simple working together	Indifference
compatible	insufficient	sufficient	Blockade	Cooperation
compatible	insufficient	insufficient	Coordinated collaboration	Cooperation
incompatible	sufficient	sufficient	Pure individual competition	Cooperation
incompatible	sufficient	insufficient	Pure individual competition	Antagonism
incompatible	insufficient	sufficient	Individual resource conflict	Antagonism
incompatible	insufficient	insufficient	Collective resource conflict	Antagonism

J. Ferber (1995) *Multi-Agent Systems*, Addison-Wesley, Munich

Conclusion

- ⇒ Using Turn-Round Scenarios allows to demonstrate the Applicability of CWA in the A-CDM System Domain
- ⇒ CWA identifies Information Sharing 'Bottlenecks' and reveals areas for possible Improvements
- ⇒ CWA allows to draw focus on decision making or conflicting interests
- ⇒ Can be used to develop a future *A-CDM Decision Support System*

A photograph of a rocket launch at night. The rocket is in the center, with a large plume of fire and smoke behind it. The background is a dark sky with a large, bright orange sun or moon. The text "THANK YOU" and "Q & A?" is overlaid on the image.

THANK YOU

Q & A?
